# ARCTIC BIBLIOGRAPHY

PREPARED FOR AND IN COOPERATION WITH
THE DEPARTMENT OF DEFENSE

UNDER THE DIRECTION OF

THE ARCTIC INSTITUTE OF NORTH AMERICA

EDITED BY
MARIE TREMAINE

VOL. VIII

DEPARTMENT OF DEFENSE

1959

#### DIRECTING COMMITTEE

- DR. HENRY B. COLLINS, Smithsonian Institution, Chairman.
- Dr. Burton W. Adkinson, Head, Office of Scientific Information, National Science Foundation.
- Mr. Robert C. Faylor, Arctic Institute of North America, Washington, D.C.
- Mr. Robert C. Gooch, Director, Administrative Department, Library of Congress.
- Representative, Department of the Army.
- Representative, Department of the Air Force.
- Representative, Office of Naval Research, Department of the Navy.
- Dr. A. L. Washburn, Dartmouth College, Hanover, N.H.
- Col. Walter A. Wood, Arctic Institute of North America, New York, N.Y.

### **FOREWORD**

The work of the Arctic Bibliography project, under the direction of Marie Tremaine, has continued with the preparation and publication of Volume 8 of Arctic Bibliography. As in past years the work has been carried out by the Arctic Institute of North America for the Department of Defense under contract with the Office of Naval Research. Funds for preparation of the present volume have been provided by the Departments of the Army, Navy, and Air Force, and printing costs have been assumed by the Department of the Air Force. A contribution from the Defence Research Board of Canada is also gratefully acknowledged.

The Library of Congress has provided office space for the project and most of the work has been carried out there. However, the facilities of many other large libraries in the United States and Canada and of polar research institutes in England, France, and Norway have also been utilized in assembling the materials for volume 8.

Continuing its coverage of the entire range of scientific literature on the arctic and subarctic regions of the world, this volume of Arctic Bibliography abstracts and indexes the contents of 5,623 publications relating to the arctic areas and to low temperature conditions. Subject fields receiving special emphasis in this volume include Body systems, human and other; Botany; Construction; Disease; Ecology; Economic and social conditions; Environmental effects of darkness, light, and low temperature on man, animals, and plants; Eskimos; Expeditions, especially Russian; Fishes and fisheries; Frostbite; Geology; Hypothermia; Ice and ice conditions; Insects; Meteorology; Mineral resources; Oceanography; Physiology; Snow; Transportation. These and some 230 other topics are listed alphabetically in the index and, as necessary, also under the name of the particular locality or major geographical region to which they pertain. There are 69 such major geographical regions, shown and numbered on the colored map at end of volume; of these, 18 include the Arctic Basin and adjacent seas, 6 are in Alaska, 17 in Canada, 5 in Greenland, 8 in Scandinavia and Finland, and 15 in the U.S.S.R.

Of the 5,623 publications abstracted in this volume, 2,762 are in English, 1,489 in Russian, 330 in German, 321 in Swedish, 229 in Norwegian, 129 in Danish. The remaining 363 entries are in French, Italian, Finnish, and 14 other languages. About four-fifths (4,549) of the publications are recent, dating from 1950 to 1956; 365 are from the period 1940–49, 393 from 1920–39, 125 from 1900–19, 190 from 1800–99, and 1 is pre-19th century. Included in the older material are the first published abstracts of the British Parliamentary Papers, an important source of geographical and historical data resulting from 19th-century British expeditions to the Canadian Arctic.

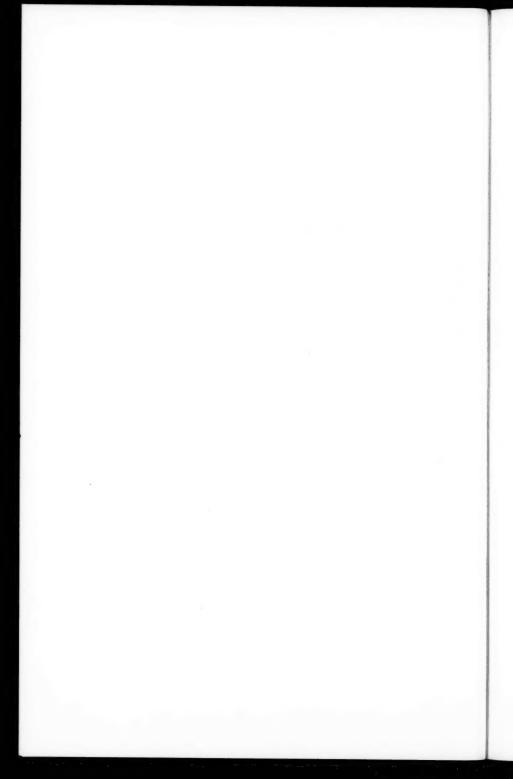

Because of intensified investigations during and subsequent to World War II there has been in recent years a marked increase in the number of scientific publications relating to the Arctic and sub-Arctic. These are now appearing at the rate of from 3,500 to 4,000 per year. About 95 percent of recent and current arctic publications are articles in journals, rather than books. These are widely scattered and in many languages, as may be seen from the list (p. xi) of journals and serial publications that have provided materials for *Arctic Bibliography*. Not included in this list are some 1,200 other journals and serials from which only one or two papers have been obtained.

The Directing Committee and Editor wish to acknowledge the generous cooperation of the Library of Congress in making working space available for the project, and of the Department of Defense and the Canadian Government whose support have made possible the preparation and publication of this volume.

Henry B. Collins Chairman, Directing Committee Arctic Bibliography

### INTRODUCTION

The advances in construction, transport, communications, and air mapping noticed in volume 7 of Arctic Bibliography are controlling factors in trends of arctic work reported in the literature of volume 8. These advances have an added impetus from research programs initiated in the south polar regions and for the International Geophysical Year generally. A common pattern of resource development and settlement is discernible in all countries facing the arctic seas. Its conspicuous features are the exploitation of mineralized areas, of marine and fresh-water fisheries: conservation and management of forest and wildlife resources; agricultural experimentation; defense installation and town building; establishment of educational and public health facilities. These developments accompany the expansion of air services, the environmental adaptation of people penetrating northward and of their techniques, with a corresponding cultural adaptation of northern natives. This new, circumpolar, economy is the outgrowth from basic research and expeditionary work reported through 1956 in eight volumes of Arctic Bibliography, and in the materials of 1957 and 1958 now assembled for volume 9.

Outstanding among the research results reported in the present volume are those of Somov's party in the Arctic Basin, now in English translation, and the Greenland icecap investigations of U.S. parties, the British North Greenland Expedition, and Expéditions polaires françaises. From earlier investigations, results of Axel Hamberg and associates' studies in the high mountain regions of north Sweden, reports of Breĭtfus' Murman and of Pakhtusov's Novaya Zemlya expeditions and the British Franklin Search voyages have been included in this volume. In some fields, comprehensive reference works coordinate the results of many scientists' work: the Russian Academy of Sciences volume on the peoples of Siberia and that on the plant cover of the U.S.S.R.,

Shereshevskii's handbook of the arctic hunter, and the marine atlas of the Russian Naval Ministry, the U.S. Office of Naval Operations' *Canadian North*, and Dr. Taylor's volumes on the Queen Elizabeth Islands among others.

Marie Tremaine Director of the Arctic Bibliography Project

February 1959

### ARCTIC BIBLIOGRAPHY PROJECT STAFF

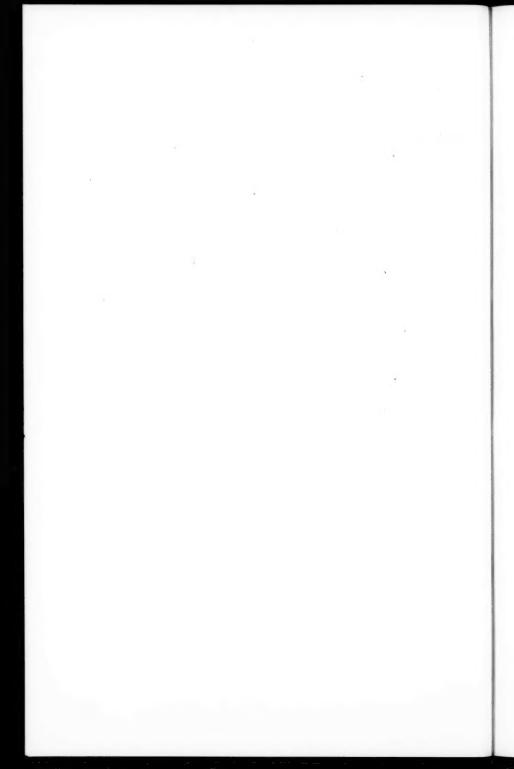

Marie Tremaine, Director, Editor
Vladimir C. Asmous, Research analyst in Botany, Zoology
Anvor Barstad, Research analyst in Scandinavian materials
Natalie Frenkley, Research analyst in Anthropology
Sylva Gethin, Research analyst in Scandinavian materials
Charles M. Gottschalk, Research analyst in Physics, Engineering
Ernest Harwood, Research analyst in Geology, Meteorology,
Oceanography

Dr. Emil Liebman, Research analyst in Biology, Physiology Dr. Clara Rom Lougee, Research analyst in Geography, Geology Pauline Riordan, Research analyst in Geography Kurt G. Sandved, Research analyst in Physics, Engineering

Nicholas P. Setchkin, Research analyst in Physics, Engineering Dr. Vladas Stanka, Research analyst in Exploration, Geography

Dr. Andrew Taylor, Research analyst of the British Parliamentary Papers on the Arctic

Dr. Vladas Viliamas, Research analyst in Geography, Geology David B. Washington, Chief Clerk

## ARCTIC BIBLIOGRAPHY

43465. ÅNGSTRÖM, ANDERS KNUTSSON, 1888- . Effective radiation during the Second International Polar Year. [Stockholm, 1936.] 22 p. diagrs., tables (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden. Serien uppsatser, no. 8.) 6 refs.

Data obtained from measurements of nocturnal radiation at Stockholm from Oct. 25, 1932 to Dec. 1933 are tabulated together with accompanying data on temperature, humidity, and cloudiness. Only a preliminary analysis of the data is given.

Copy seen: DWB.

43466. ÅNGSTRÖM, ANDERS KNUTSSON, 1888— . Jordtemperaturen i bestånd av olika täthet. [Stockholm, 1936.] p. 187–218, diagrs., illus., tables. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden. Serien uppsatser, no. 5.) 4 refs. Text in Swedish. Summary in English. Title tr.: Soil temperature in stands of different densities.

Soil temperatures at depths of 15, 30, and 45 cm. were measured in spruce stands of different densities near Vindeln in northern Sweden. Summer soil temperatures were found to be 2°-3° C. higher in the heavily thinned stand than in the unthinned one. Frozen soil was found to melt 2-4 weeks earlier in the thinned stand. A small but noticeable rise in temperature was noted in the thinned stands due probably to the warming effect of the snow cover.

Copy seen: DWB.

43467. ÅNGSTRÖM, ANDERS KNUTSSON, 1888— . Lufttemperatur och temperaturanomalier i Sverige 1901–1930. Stockholm, 1938. 69 p. 12 plates, tables. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, bd. 7, no. 2.) 16 refs. Text in Swedish Summary in English. Title tr.: Air

temperature and temperature anomalies in Sweden, 1901-1930.

Temperature data for 188 stations were reduced to sea level and related to latitude in order to eliminate the latitudeelevation effects. A nearly linear relation was found between latitude and the mean temperature. A characteristic slope of the linear curve is derived for each month. Deviations from the mean reduced temperatures are tabulated for approximately 70 stations which give a picture of the distribution of temperature anomalies which, in turn, give a clearer picture of the maritime effects on the temperature regime. Monthly anomaly charts are also given which show isolines of deviation from the reduced temperature values.

Copy seen: DWB.

43468. ÅNGSTRÖM, ANDERS KNUTSSON, 1888– . Nederbördsklimatets ändring i nuvarande tid. Stockholm, 1941. 17 p. diagrs., map, table. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden. Serien uppsatser, no. 37.) 5 refs. Text in Swedish. Summary in English. *Title tr.:* The variation of the precipitation climate in present time.

The mean annual precipitation during 1901–1930 for a number of Swedish stations is compared with that for 1861–1900. A small increase was noted, amounting up to five percent for Norrland. A further indication of an increase in precipitation for northern Sweden is the slight measured increase in the duration of the snow cover from 190 to about 210 days in western Norriand.

Copy seen: DWB,

43469. ÅNGSTRÖM, ANDERS KNUTSSON, 1888–, and S. JACOB-SON. Temperaturmätningar i Vänern och Götaälv. Stockholm, 1940. 20 p. illus., diagrs., tables, and 10 p of graphs, 2 maps incl. 1 double fold. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, bd. 7, no. 6.) Approx. 200 refs. Text in Swedish. Summary in English. *Title tr.:* Temperature measurements in Vänern and Götaälv.

The special equipment designed to obtain accurate temperature measurements at various depths is described, and results of studies undertaken in 1930-31 are tabulated and discussed. Practically no vertical temperature gradients were found in the river Götaälv although depths ranged from 2-20 m. and velocity from 10-30 cm./sec. Large temperature gradients were found in Lake Vänern only during the summer. At the time of ice formation, the water temperature in the lake is near 0° C. at all depths. After ice covers the lake and a snow cover forms, the temperature of the river draining the lake often shows a rise in temperature, reflecting the heat gained through bottom radiation. Copy seen: DWB.

43470. ÅNGSTRÖM, ANDERS KNUTSSON, 1888– . Vädret om hösten. (Svenska turistföreningen, Stockholm. Årsskrift, 1954, p. 195–208, illus., diagr., 7 text maps.) Text in Swedish. *Title tr.*: Autumn weather.

Text and maps, from the Atlas of Sweden (No. 48290) indicate progress of fall conditions across the country from the northwestern mountains early in Aug.: dates when fall ends and winter begins, number of days duration of fall, number of days with fog in spring and fall, and occurrence of damaging frost. The mountain region to the west, especially in the northwest, stands out as a section with early and short fall season.

Copy seen: DGS.

43471. AARIO, LEO. Climatic changes and cultural geographic development. (In: International Geographical Union. Eighth General Assembly and Seventeenth International Congress, Washington, D. C., Aug. 8–15, 1952. Proceedings, pub. 1956? p. 265–68.)

Presents climatic developments in Europe and North Africa in the late Quaternary (approx. 8000–1000 B. C.) as result of the shifting of the wind zones; also examples of the influence of these factors on development of human habitation. This paper results from research in northern and middle Europe, and the chronology is based on development of

the Baltic, with some references to the Blytt-Sernander chronology. Climate in Fennoscandia and northern middle Europe during the Yoldia Sea to Littorina Sea phases is briefly described. Different climatic developments during this period in the far North in the Petsamo (Pechenga) area (69°33′ N. 31°12′ E.) and in southern Europe and North Africa are noted. The Petsamo area now lies on the border zone of southwest winds and arctic northeast winds. This position may explain the difference between climatic trends here and those to the south during the 8000–1000 B. C. period.

Copy seen: DGS.

43472. AAS, JOHAN, 1885— . Rødblomstret nøkkerose i Laupmotjønna, Naerøy. (Blyttia, 1954. bd. 12, hefte 1, p. 19–21, 2 illus.) Text in Norwegian. Summary in English. *Title tr.:* Nymphaea with red flowers found in the lake, Laupmotjønna, Naerøy.

Reports find of this red waterlily in a small lake in the Nord-Trøndelag region of northern Norway; probably it should be referred to N.candida.

Copy seen: DA.

43473. AASTVEIT, KNUT. Beskrivelse og klassifisering av 24 byggsorter. (Forskning og forsøk i landbruket, 1954. bd. 5, hefte 4, p. 249–92, 35 illus., 2 tables.) 37 refs. Text in Norwegian. Summary in English. *Title tr.:* Description and classification of 24 varieties of barley.

Includes description of the variety, Dønnes (p. 261), developed in Nordland, and Fløya (p. 266), one of the best yielders in Troms. Length of time and degree days from seeding to heading and to maturity are included in information for each variety. Copy seen: DA.

43474. ABBE, ERNST CLEVELAND, 1905— . Braya in boreal eastern America. (Rhodora, Jan. 1948, v. 50, no. 589, p. 1–15, plates 1088–90.) Pub. also as. Contrib. from the Herbarium of the University of Minnesota, no. 6.

A critical study, with keys to the species and geographic races, and descriptions of five species and six races of B. humilis, with lists of specimens. These plants are widely distributed in Greenland, northern regions of Canada, Ellesmere, Baffin and the Canadian Arctic Islands generally. B. fernaldii n. sp. is endemic to Newfoundland. Copy seen: DA.

43475. ABBOTT, IRVING W. Seed certification work in Alaska. (*In:* Alaskan Science Conference . . . 1952. Proceedings, *pub.* 1954, p. 194.)

Information is presented on the reasons for seed certification; the Alaska Certified Seed Growers' Association and its activities; seed control work of the Dept. of Agriculture, the Soil Conservation Service and the University of Alaska; control of seed diseases, etc. *Copy seen:* DGS.

43476. ABE, SANSHI, and T. NEI. The influence of exercise in low-temperature environment on the physiological functions of human body. (Teion kagaku, 1956. v. 14, ser. B, p. 87–108, illus., tables.) 11 refs. Text in Japanese. Summary in English.

Account of experiments with 21 persons exposed to -40° C. in artificial wind of 10 m/sec. Manual work and weight carrying were thus tested for an hour. Then the following physiological perimeters were ascertained: pulse, blood pressure, ECG; albumin, uribilinogen and Ogawa's colloid reaction of the urine; psycho-nervous responses; physical strength; skin temperatures, etc.

Contains information on general differences between blue for rations and those for silver foxes, followed by a study of food requirements of polar (blue) foxes made over a three-year period. Percentage of successful impregnation, number of young, their weight, digestion and protein utilization were applied as criteria of proper diet. Composition of food for young and adult animals and its cost, are also discussed. Copy seen: DLC.

43480. ABRAMOVA, A. L., and Z. N. SMIRNOVA. L. I. Savich-Líūbitŝkaſa: k 70-letiſu so dnſa rozhdenſa. (BotanicheskiI zhurnal, Oet. 1956. t. 41, no. 10, p. 1555-64, port.) 68 refs. Text in Russian. Title tr.: L. I. Savich-Lſūbiſŝkaſa; on the occasion of the 70th anniversary of her birth.

Contains biographical data and an appreciation of the scientific activities of this prominent botanist and explorer of northern regions of the U. S. S. R. Her expeditions to Kola Peninsula (1925 and 1927), Novaya Zemlya, Kolguyev and Vaygach (1935) and to Khibiny and Arkhangel'sk Province (1938) are noted. A critical review of her works, some dealing with arctic regions, and a bibliography of them are added.

Copy seen: DLC.

43481. ABRAMOVA, A. L. Mkhi severo-vostoka Azii. (Akademia nauk SSSR. Botanicheskii institut. Trudy, ser. 2, Sporovye rastenia, 1956. vyp. 10, p. 490–511, 11 illus.) 34 refs. Text in Russian. *Title tr.:* The mosses of northeastern Asia.

Contains a systematic annotated list of 66 species of mosses and hepatics, collected chiefly in the Anadyr' basin and the Chukotsk Peninsula. Distribution of the more interesting species (Macrodiplophyllum microdontum, M. plicatum, Sphagnum orientale and S. perfoliatum) is given from Bering Strait to Novaya Zemlya (fig. 1, 6, 7).

Copy seen: DA.

43482. ABRAMOVA, A. L. Monograficheskil obzor semelstva Meesiaceae v SSSR. (Akademifa nauk SSSR. Botanicheskil institut. Trudy, ser. 2, Sporovye rasteniia, 1956. vyp. 10, p. 393-489, 30 illus., 12 text maps.) 279 refs. Text in Russian. Title tr.: A monographic review of the fam. Meesiaceae in the U.S.S.R.

Contains characteristics of this moss family, a table for determination of genera, followed by monographic treatment of three genera, five species and some varieties. Descriptions, synonyms, illustrations, exsiccata are given, also data on morphology, anatomy, ecology, habitats and geographic distribution. Six species of the genus Meesia growing outside of the U.S.S.R. are also described. The total distribution of Russian species covers practically all arctic regions of Europe, Asia and North America. Copy seen: DA.

43483. ABS, OTTO AUGUST HANS, 1891- . Literaturverzeichnis zum Artikel "Kälteschädigungen auf Polarexpeditionen." (Polarforschung, May 1956. Jahrg. 24, Heft 1-2, p. 278-80.) Text in German. *Title tr.:* Literature to the article "Cold injuries on polar expeditions."

Contains 66 references as bibliography to No. 33134; with additional notes on nervous symptoms due to the effect of cold. The references cover expeditionary and preventive medicine, cold effects and injuries, clothing, diet, hygiene, etc. Copy seen: DLC.

43484. ABS, OTTO AUGUST HANS, 1891- . Neues aus der Polarmedizin,

 (Polarforschung, May 1956. Jahrg. 24, Heft 1–2, p. 273–78.) 19 refs. Text in German. Title tr.: News of polar medicine, 1.

Contains a critical discussion of recent, non-German polar literature with comment and illustration from Abs' own experience. "Arctic hysteria" and mental strain caused by long winter darkness form the main part of the account. In addition, some animal diseases, diet, caloric intake and need, trichinosis, etc. are considered. Copy seen: DLC.

43489. ADMINISTRATIVNO-TERRITORIAL'NOE DELENIE RSFSR NA 1 ÎANVARÎA 1955 GODA. Moskva, Izd-vo "Izvestifa sovetov deputatov trudfashchikhsfa SSSR," 1955. 440 p. (Informatŝionno-statisticheskil otdel pri Prezidiume Verkhovnogo Soveta RSFSR.) Text in Russian. Title tr.: The administrative territorial division of the R. S. F. S. R. to January 1, 1955. Previous editions in 1947, 1950.

The RSFSR., 16,896,000 sq. km. in area, is divided into six regions (kray), 53 provinces (oblast') and 12 autonomous republics; these in turn, are divided and subdivided into 12 autonomous provinces, 10 national districts and 2,446 districts; 1,124 towns and cities, 1,285 workers' settlements and health resorts, and 27,401 villages with village councils (sel'skil sovet) are within the RSFSR. names of all these administrative units are given by region and province, and are listed (except the villages) in an alphabetical index. Administrative units covering the arctic and sub-arctic areas are included: Krasnoyarskiy Kray with Taymyrskiy (Dolgano-Nenetskiy) and Evenkiyskiy National Districts (p. 18-33); Kamehatskaya Oblast' with Koryakskiy National District (p. 42-44); Arkhangel'skaya Oblast' with Nenetskiy National District (p. 57-61); Magadanskaya Oblast' with Chukotskiy National District (p. 187-90); Murmanskaya Oblast' (p. 211-12); Tyumenskaya Oblast' with Khanty-Mansiyskiy National District (p. 301-308); Komi A. S. S. R. with the towns of Vorkuta, Ukhta and Inta (p. 367-69); Yakut A. S. S. R. (p. 390-94). The arctic islands are only mentioned: Severnaya Zemlya (p. 27), Novaya Zemlya, Zemlya Frantsa-Iosifa, Kolguyev, Vaygach, Matveyend Solovetskiye (p. 58), Vrangel and Geral'd (p. 190). Copy seen: DLC.

43490. ADOLPH, EDWARD FRED-ERICK, 1895-, and J. RICHMOND. Adaptation to cold in golden hamster and ground squirrel measured chiefly by rates of body cooling. (Journal of applied physiology, July 1956. v. 9., no. 1, p. 53-58, illus., tables.) 7 refs.

A study of animals exposed to cold environments and to variously induced hypothermias, aimed to ascertain which is most efficient in producing cold adaptation. Moderate, general hypothermia proved the most adequate stimulus in this respect. Hamster, squirrel and rat showed similar kinds of physiological modifications in the cold adapted state. *Copy seen:* DNLM.

43491. ADOLPH, EDWARD FRED-ERICK, 1895—. Effects of low body temperature on tissue oxygen utilization. (In: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia . . . symposium, Oct. 1955, pub. 1956. p. 44–49, illus.) 24 refs.

An analysis of the fundamental problem whether or not hypothermic death is due to lack of O<sub>2</sub>, as claimed by a number of investigators. Oxygen delivery to the cell enzymes is discussed in its successive stages of breathing, circulation, O<sub>2</sub>-transport in blood, tissue pO<sub>2</sub> and O<sub>2</sub>-transfer in cells. In all these stages oxygen sufficiency was found during deep hypothermia. The author concludes "that cold death results from changes other than failure of oxydation." Copy seen: DLC.

43492. ADOLPH, EDWARD FRED-ERICK, 1895-, and J. RICHMOND. Water exchanges of isolated mammalian tissues at low temperatures. (American journal of physiology, Dec. 1956. v. 187, no. 3, p. 437-44, illus., tables.) 3 refs. Reports investigation of isolated diaphragm, auricle, liver and kidney (the two latter also in slices) from rats and ground squirrels. At  $6^{\circ}$  and  $16^{\circ}$  C. the tissues took up water from isotonic saline. Both warmth and  $O_2$  were necessary to resist this swelling. The changes due to cold, anoxia, etc., were reversible.

Copy seen: DLC.

43493. AFANAS'EV, M. S. Mestorozhdenie lovchorrita na lŪkspore. (*In:* Khibinskie apatity, 1933. t. 6, p. 105–107). Text in Russian. *Title tr.:* Lovchorrite

formations in Yukspor.

Location and sequence of the lovehorrite formations is described as, geochemically, a component of the rare
earth arch. Geological structure is
noted, with location of various types
of mica-nephelinic syenites, containing
lovehorrite. Total capacity of the
formation is estimated as approx. 8,000
tons. New radiometric method used
in the surveying work showed satisfactory
results. Copy seen: DGS.

43494. AFANAS'EV, V. A. Zametki o skandinavskom zverovodstve. (Karakulevodstvo i zverovodstvo, 1956. god 9, no. 3, p. 52–58; no. 4, p. 54–58; no. 5, p. 47–53, illus. tables.) Text in Russian. *Title tr.* Notes on Scandinavian fur farming.

A review of 1955 conditions in this field, which includes arctic and silver fox farming. Deals with markets and exports, kinds of animals bred, types of farms, research. Ways of raising animals is treated in some detail and with illus.: housing, service, food, propagation, care of the young, etc. Copy seen: DLC.

43495. AGAPITOV, N. N. Svíedieniía o vskrytii i zamerzanii ríčk Vostochnof Sibiri s 1874 po 1881. (Vsesofůznoe geograficheskoe obshchestvo. Vostochno-Sibirskii otdel. Izvestiía, May 1881. t. 12, no. 1, p. 29–35, tables.) Text in Russian. Title tr.: Data on the opening and freezing of rivers in eastern Siberia from 1874 to 1881.

Ice conditions of the main Siberian rivers, the Lena, Yenisey, Angara among others, are analyzed for the period 1874–1881. Rivers flowing from south to north open earlier in the upper reaches and freeze earlier in the lower. Extreme dates for the ice period range from mid-Sept. to early June. Annual data on break-up and freeze-up are tabulated for

several points on the main rivers and their tributaries, also for lakes and bays.

Copy seen: DLC.

43496. AGEE, WALTER R. Significance of polar exploration by air. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1943, p. 140–43.)
Contains brief historical survey of

Contains brief historical survey of early air exploration of the Arctic: flights of Andrée, Amundsen, Byrd, Eielsen, Nobile, Levanevskii. The U. S. Air Force Ptarmigan flights and current ice island activities are noted.

Copy seen: DGS.

Trudy, 1953, vyp. 57, Voprosy geografii kapitalisticheskikh stran, 1, Raskhishehenie prirodnykh resursov, p. 66–86.) Approx. 60 refs. Text in Russian. Titte tr.: The rapacious character of colonization of the American North.

Summarizes critical reports and comments, in part from American publications, on the depletion of natural resources in Alaska, Canada and Greenland and on the exploitation and demoralization of the native population. The former Russian rule in Alaska is extolled, and Americans are blamed for annihilating the results of it (p. 66–72). Using parts of the American far North for military installations is bitterly assailed.

43498. AGRESTI, PAUL L. Phase V low temperature functional evaluation of a C-118A aircraft in the Climatic Projects Laboratory. Wright-Patterson Air Force Base, Ohio, U. S. Air Force. Wright Air Development Center, Air Research and Development Command, Aug. 15, 1955. 19 [13], 20 p. illus., tables. (Its: WADC-TN-55-278. System no. T-01-P.)

"The C-118A aircraft, USAF No. 52-3241, was subjected to functional tests at ambient temperatures of +70°.  $+20^{\circ}$ ,  $-20^{\circ}$ ,  $-40^{\circ}$ , and  $-65^{\circ}$  F., and to limited testing at  $+130^{\circ}$  F. Engine runs and functional tests of all major systems were accomplished at each temperature. The major low temperature deficiencies encountered during the test include (1) unreliable propeller reversals at temperatures below +20° F. with the standard propeller dome, (2) failure of the main landing gear to lock in the 'UP' position when cockpit control lever was put in the 'UP' position, (3) lack of air pressure retention in emergency air brake storage at or below -20° F. and, (4) completely unsatisfactory nature of the APU at low temperatures." 43500. AHLBERG, GÖSTA. Befolkningsutvecklingen och urbaniseringen i Sverige 1911-50. Stockholm, K. L. Beckmans boktr., 1953. viii, 420 p. (Monografier utg. av diagrs., tables. Stockholms kommunalförvaltning.) Thesis to Stockholms högskola. Text in Swedish. Title tr.: Population development and urbanization in Sweden, 1911-1950.

Systematic methods that can be used in forecasting future trends are developed from analyses of past population changes. Topical treatment includes relation of individual settlement to causes of increased population, standardization of causes of growth as basis for future predictions, nature of census information and its shortcomings, population development in response to changing occupational structure, and growth and changes as

legitimate clues to the future. In chapter 3, on regional differences in population development, and in subsequent chapters on differentiation between size and density changes in individual localities and between basically different industries, population changes in northern Sweden are systematically treated, comparably with those of the rest of the country.

43501. AHLENIUS, KARL **JAKOB** MAURITZ, 1866-1906. Beiträge zur Seenkettenregion Kenntnis der Schwedisch-Lappland. Uni-(Upsala. versitet. Mineralogisk-geologiska institut. Bulletin, 1900, pub. 1901. v. 5, pt. 1, no. 9, p. 28-80, 19 tables, text map) Refs. in text. Text in German. Title tr.: Contributions to information on the lake chain region in Swedish Lapland.

Between 63°20' and 68°30' N. lat. in Sweden, a series of lakes radiates from the upland in major northwest-southeast lake-stream valleys. Location, geomorphology, and configuration of lake beds are related to positions of the ice mass during the glacial period, to differences in Cambro-Silurian and earlier rocks and to late-glacial deposits. temperature and temperature stratification are correlated with varying depths of individual lakes and to glacial stream sources. Of the lakes north of the Arctic Circle, only those of the Lille Lule, Perl, and upper Pite river systems are discussed in detail. Copy seen: DLC.

43502. AHLMAN, AXEL. Harald Moltke. (Polarboken, 1956, p. 122–36, 2 illus.) Text in Norwegian.

Harald Moltke, aged 85, is described as one of the famous figures of the Arctic. His Greenland experiences and association with Knud Rasmussea and Mylius-Erichsen are briefly stated, and his principal contributions to art and literature enumerated. His sympathetic understanding and interpretation of Eskimo life and Greenland landscape are stressed. Two paintings, one of Rasmussen, are reproduced.

Copy seen: DLC.

43503. AHLMANN, HANS WIL-HELMSSON, 1889 - . Karta över den årliga nederbördens fördelning på Skandinaviska halvön. Stockholm, 1925. 8 p. diagrs., fold. map. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, bd. 3, no. 4.) Text in Swedish. Summary in French. Title tr.: Map of the annual precipitation distribution on the Scandinavian Peninsula.

Data on mean annual precipitation for Norway and Sweden are mapped. Data for Sweden are reproduced from an earlier map of A. Wallén. A general discussion (cf. No. 48845) is given of the distribution of precipitation in the two countries. The annual amount of precipitable water for the area varies from 250 to over 5,000 mm. Two profiles showing precipitation and elevation are included, one running along the meridian between 63°40′-63°50′ N. lat. and the other from 66°25′ N. lat. on the north coast of Norway to 65°40′ N. lat. on the Gulf of Bothnia. Copy seen: DWB.

43504. AHLMANN, HANS WIL-HELMSSON, 1889 . Kebnekajse. (Svenska turistföreningen, Stockholm. Årsskrift, 1952, p. 265–88, 13 illus., text map.) Text in Swedish. Title tr.: Kebnekaise.

Topographic features of the Kebnekaise massif and its approach are outlined. Its glaciers and their variations from their greatest extent about the year 1750 are discussed. The research station is described: the planning, construction, supply, etc., glaciological investigations carried out, research methods experimentally tried, and their value. Kebnekaise depends mainly on air transport, as it is 93 km. from Kiruna and 63 km. from the nearest highway, at Holmajärvi. Though modern facilities are introduced thus by tourists and scientists, the area's natural resources are utilized only by the nomadic Lapp. Copy seen: DGS.

43505. AHLMANN, HANS WIL-HELMSSON, 1889—. Summary of reports from the Nordic countries. (In: International Geographical Union. Eighth General Assembly and Seventeenth International Congress, Washington, D. C., Aug. 8–15, 1952. Proceedings, pub. 1956? p. 207–208.)

Reports (to the Commission on Periglacial Morphology appointed by the 16th IGU Congress, 1949) deal mainly with Recent features. In Svalbard permafrost exists to considerable depth and solifluction occurs wherever there is loose material. Most characteristically-developed polygons occur on the strandflat, inner parts of flat valleys, on mountain

plateaus where weathered material covers bedrock. Periglacial structures in Greenland (not discussed) are similar to those of Svalbard. In Norway, Sweden and Finland isolated permafrost areas occur. Solifluction and other periglacial phenomena, palses, and occurrence of fossil sand dunes in these countries are noted.

Notes on selected engineering problems in the Arctic. The proper construction of utilidors, the use of piling or insulation for buildings on permafrost, and construction of an ice bridge are illustrated.

Copy seen: DLC.

43508. AIRCRAFT ACCIDENT AND MAINTENANCE REVIEW. Before the next thaw. (Aircraft accident and maintenance review, Sept. 1954. v. 9, no. 9, p. 4-11, illus., diagr.)

Contains suggestions for aircraft maintenance crews concerning the preparation for starting of reciprocating engines, hazards of oil dilution, cowl flap operation, engine starting, warm-up, ground test, taxiing, aircraft structures, securing the aircraft, ice and frost removal, defrosting liquid, fuel and oil systems, hydraulic systems, pneumatic equipment, Pitot static system, heating, anti-icing, and de-icing systems. Copy seen: DLC.

43509. AIRCRAFT ACCIDENT AND MAINTENANCE REVIEW. Cold oil. (Aircraft accident and maintenance review, Sept. 1954. v. 9, no. 9, p. 2-3, illus.)

Describes crack-up of a C-47 due to failure and fire in the no. 1 engine caused by improper pre-heating and dilution of the engine oil. The aircraft had been parked in temperatures as low as  $-40^{\circ}$  F. during 40 hrs. after being towed out of the maintenance hangar two days before and the engine oil diluted for four minutes. The engines had not been preheated for a sufficient length of time and the oil tank was not properly pre-heated with external heat. Copy seen: DLC.

43510. AIRCRAFT ACCIDENT AND MAINTENANCE REVIEW. Frigid facts about snow removal. (Aircraft accident and maintenance review, Sept. 1954. v. 9, no. 9, p. 12–13, illus.)

Describes snow-removal plan for airbases. Method of operation, including the responsibilities of the operations, weather, installations, and flight safety officers, snow removal equipment, abrasives, salts, and runway marking are outlined.

Copy seen: DLC.

43511. AIRCRAFT ACCIDENT AND MAINTENANCE REVIEW. Repairs in the raw. (Aircraft accident and maintenance review, Sept. 1954. v. 9, no. 9, p. 19-21, illus.)

Contains suggestions for field maintenance crews who might repair downed aircraft at low temperatures. Proper clothing, shelter, heating, and operating procedures are outlined.

Copy seen: DLC.

43512. AIRCRAFT FLASH. GOC in Alaska. (Aircraft flash, Feb. 1956. v. 4, no. 7, p. 4-5, illus.)

Organization and operation of the Ground Observer Corps from Bering Sea islands to the Canadian border are described. Volunteer observers are local inhabitants, native or white, of diverse occupations. All reporting is by radio, directly into the air defense system, this being the only corps in the Air Defense Command which does not employ filter centers. Copy seen: DLC.

43516. AKADEMIÑ NAUK SSR. O zadachakh i programme nablûdenit mezhdunarodnoï sluzhby shiroty. Moskva, Izd-vo Akademii nauk SSSR, 1954. 107 p. tables. Text in Russian and French. Title tr.: Purposes and pro-

gram of observations of the International Latitude Service.

Organization (in 1899), work, and changes in program of the International Latitude Service are briefly outlined in the editor's preface; followed (p. 8–12, 78–82) by a sketch of the life of A. A.

Orlov, 1880-1954, the outstanding Soviet astronomer, and his work on variations of latitude and on secular movement of the poles, by B. A. Orlov. Then follow four papers, as listed below with titles translated:

Secular movement of the poles (p. 13-18, 83-88) by A. IA. Orlov: a summary and analysis of the results of 258,692 observations of latitude, carried out during the 50-year period by Mizusawa, Carloforte and Ukiah stations, with conclusion that the North Pole in its secular movement proceeds along 69° W. with speed of 0".004 annually (p. 16 and 86).

Observations at Poltava to test the new program of the International Latitude Service (p. 19-55, 89-95) by E. P.

Revision of program of the zenith telescope in Pulkovo (p. 56-64, 96-102) by Sakharov, V. I., and I. F. Korbut. Suggestions by astronomers of the U. S. S. R. referring to the Commission no. 19: variations of latitude, (p. 65-72, 103-106) by A. IA. Orlov, and others. Copy seen: DLC.

AKADEMIIA NAUK SSSR. Ob itogakh raboty sobranifa aktiva uchenykh v Novosibirske. (Its: Vestnik, Aug. 1956. god 26, no. 8, p. 81-82.) Text in Russian. Title tr.: Results of the conference of scientists at Novosibirsk.

Notes proceedings of the conference held on Apr. 24-25, 1956; organizing of the Institute of Geology of the Yakut Branch (filial) of the Academy of Sciences. Copy seen: DLC.

43518. AKADEMIIA NAUK SSSR. Pamíati V. A. Obrucheva. (Its: Vestnik, Aug. 1956. god 26, no. 8, p. 58-59, Text in Russian. Title tr.: port.) In memory of V. A. Obruchev.

Announcement of the death of Vladimir Afanas'evich Obruchev, 1863-1956, issued by the Council of Ministers, Academy of Sciences, several ministries, Union of Soviet Writers, and the Geographical Society. His outstanding studies of the geology of Siberia and his leading role in the Soviet exploration of permafrost are noted. Copy seen: DLC.

AKADEMIÑ NAUK SSSR. 100 let so dnî rozhdeni î ÎU. M. Shokal'skogo. (Its: Vestnik, Dec. 1956. god 26, no. 12, p. 113-15.) Text in Russian. Title tr.: The centenary of the birth of IU. M. Shokal'skii

Reports memorial celebrations for the Soviet geographer and explorer, IUliI Mikhallovich Shokal'skil, 1856-1940. held in Moscow and Leningrad by the Geographical Society and Moscow Society of Naturalists. Address by B. P. Orlov on the life and achievements of Shokal'skil is summarized. Copy seen: DLC.

43520. AKADEMITA NAUK BOTANICHESKIĬ INSTITUT. Rastitel'nyl pokrov SSSR. Pofasnitel'nyl tekst k "Geobotanicheskol karte SSSR," m. 1:4 000 000. Pod red. E. M. Lavrenko i V. B. Sochavy. Moskva, Izd-vo Akademii nauk SSSR, 1956. 2 v.: 971 p. illus., tables, maps. Approx. 500 refs. in Russian. Title tr.: The plant cover of the U.S.S.R. Explanatory text to the "Geobotanical map of the U. S. S. R." scale 1:4,000,000. Edited by E. M. Lavrenko and V. B. Sochava.

An extensive study of the plant cover and plant zones of the Soviet Union. The material is arranged in 20 chapters, in a general north-south order. following chapters deal partly, or in full, with arctic areas or conditions: Introduction, by V. B. Sochava (p. 9-60) with an historical outline of Russian phytogeographical investigation (including map making) as from the mid-18th century. Arctic and subarctic zones are included and the work in them since the Revolution detailed, not excepting the present monograph and map.

Arctic deserts and tundras, by V. B. Sochava and B. N. Gorodkov (p. 61-138) contains a general account, followed by descriptions of the flora of rocks, arctic deserts, mountain tundra, arctic tundra and several other types of tundra. The larger zones in this group are further subdivided geographically in a west-toeast direction.

Dark coniferous forests, by V. B. Sochava (p. 139-216) deals with forms common in the zone south of the previous one and includes the great forest resources of the Soviet Arctic. Like the previous chapter it contains a general part followed by descriptions of a series of phytogeographic areas. Pine forests, by A. M. Semenova-Tıan-Shanskaıa (p. 217-48) covers forests which extend over arctic Europe but otherwise reach only the margin of the arctic zone; arrangement of this and the following sections as before. Larch forests, by V. B. Sochava (p. 249-318) includes species making up the forests of the Asiatic Birch and aspen forests, by T. I. Isachenko and A. N. Lukicheva (p. 319-45), are relatively briefly described due to their paucity. In the Arctic they cover significant areas only on the Kola Peninsula and in Kamchatka. A small chapter by M. M. Gollerbakh and V. B. Sochava (p. 835-39) deals with the vegetation of glaciers in arctic and other areas.

Geobotanicheskaîa karta SSSR, sostavlena B. N. Gorodkovym [i dr.] pod rukovodstvom i red. E. M. Lavrenko i V. B. Sochavy. Prilozhenie k knige "Rastitel'nyI pokrov SSSR." [Leningrad, 1955.] col. map 162 x 239 cm. on 8 sheets 90 x 67 cm. Title tr.: Geobotanical map of the U. S. S. R., compiled by B. N. Gorodkov [and others], directed and edited by E. M. Lavrenko and V. B. Sochava. Supplement to the book, Rastitel'nyI pokrov SSSR.

The map in several, and excellent, colors shows areas and vegetation in detail, e. g., five types of tundra, and three kinds of taiga are represented on it. Several small inset maps offer general views on forest distribution, zones, etc.

43522. AKADEMIIA NAUK SSSR. INSTITUT ÉTNOGRAFII. Narody Sibiri. Pod red. M. G. Levina, L. P. Potapova. Moskva, Izd-vo Akademii nauk SSSR, 1956. 1,083 p. illus., col. plates, fold. maps. (Narody mira; étnograficheskie ocherki.) Approx. 800 refs. Text in Russian. Title tr.: The peoples of Siberia. Edited by

M. G. Levin, L. P. Potapov. Basic work: 34 papers, most prepared by members of the Institute of Ethnography. Three comprehensive, background papers are followed by eight on peoples of southern Siberia, and 23 on those of the North and Far East, as listed below with titles translated. Most, similar in scope and presentation, deal with a specific people, its economy, material culture, customs, social conditions and religion, its area, movements, and population (data of 1926 census); they deal, first, and at length, with the pre-Revolutionary period; then in a second, shorter section, with the Soviet phase, in which collectivization, technical advances, education, etc., are stressed. The papers are based on the last 30-40 years' research and the principal museum collections in the U. S. S. R. Introduction (p. 9-20) gives general information on the population of Siberia, native and Russian: languages, hunting and fishing economy of the North, nomadism, tribal organization, native cultures and Russian (historical) influence on cultural development, achievements under the Soviet rule, etc.; 17th century distribution of native ethnic groups is mapped (see also No. 43835). Appendices (p. 991-1082) include a bibliography (with some non-Russian sources) usefully arranged to amplify successive papers; a glossary of local terms; and an index, strong in geographic features. The work is extensively illustrated with photographs, some in color, and drawings. A fold. col. map (1:8,000,000) shows distribution and approximate density of 37 ethnic groups, 25 of them northern peoples. It is based on one prepared in 1951 (cf. No. 30424). The comprehensive papers, those on the Yakuts, and all on peoples of the North and Far East are abstracted in this Bibliography under their authors' names.

AKADEMIIA NAUK SSSR. 43523. INSTITUT GEOGRAFII. Sneg i talye vody; ikh izuchenie i ispol'zovanie. Moskva, Izd-vo Akademii nauk SSSR, 1956. 272 p. illus., tables, diagrs., graphs, maps. Text in Russian. *Title* tr.: Snow and snow water; their study and utilization. G. D. Rikhter, editorin-chief.

A collection of articles based on papers presented at the Interdepartmental Conference on problems of snow study, called by the Academy of Sciences' Institute of Geography in Dec. 1954. Other papers similarly presented, and devoted to the problems of combatting snow drift and avalanches on roads and on utilization of snow in agriculture were published simultaneously in separate volumes (not seen). These 18 papers deal with physical and mechanical characteristics of the snow cover, snow melting and run-off, the geographic aspects. Each includes list of pertinent references, and a comprehensive survey of the literature of 1950–1954 closes the volume. Tikhomirov's paper is described in this bibliography under his name.

43524. AKADEMIÑ NAUK SSSR. INSTITUT GEOGRAFII. URSS. Bibliographie concernant les formations périglaciaires et le pergélisol en URSS. (Biuletyn peryglacjalny, 1956. nr. 4, p. 37-46.) Text in French. Title tr.: U. S. S. R. Bibliography concerning periglacial formations and the pergelisol in the U. S. S. R. One of the reports of the Commission of Periglacial Morphology, International Geographical Union.

Contains brief explanatory text and list of 152 Russian publications dealing with soil formation, permafrost, frost action, solifluction, patterned ground, hydrolaccoliths, the tundra, etc. In each case, the Russian titles are translated into French, English, or German.

Copy seen: CaMAI.

43525. AKADEMIÑ NAUK SSSR. INSTITUT GEOGRAFII. Voprosy izucheniâ snega i ispol'zovaniâ ego v narodnom khozîâistve. Moskva, Izd-vo. Akademii nauk SSSR, 1955. 176 p. illus., tables, diagrs. Text in Russian. *Title tr.*: The study of snow and its utilization in the national economy.

Contains nine papers dealing with the physical characteristics of the snow cover, its protective effects on fertile soil; the importance of its moisture supply in thawing, etc. Only a few of the problems affecting the national economy are dealt with however, and extension of the study

is recommended. While few of the data cited are derived from localities within the Arctic, all the papers have relevance to problems of that area, viz:

Rikhter, G. D. Ispol'zovanie snega v narodnom khozîaîstve i zadachi ego izucheniâ (The utilization of snow in the national economy and problems of study), p. 5–23. A suggested program of investigations, with principal problems: study of the physical, mechanical and aerodynamic properties of snow and the snow cover, and conditions of formation and metamorphism; also effects of snow cover on climate, hydrology, soil, flora, fauna and geomorphic proces-

Sulakvelidze, G. K. Nekotorye fizicheskie svoľstva snezhnogo pokrova (Some physical properties of a snow cover), p. 24-54. "Results are given of a comprehensive study on the physical properties of a snow cover, initiated in 1946 by the Institute of Physics and Geophysics of the Georgian Academy of Sciences and carried out both in the laboratory and at several points in the Caucasus Mts., including tabulated data and an analysis of meteorological effects on their values. Data obtained by other investigators are revised. The study covers compression, extension, friction, cohesion, viscosity, reflection, brightness and light absorption, heat transmission, electric properties, etc.; also problems of avalanche formation and movement. Formulas describing avalanche processes mathematically from the physical properties of the snow cover and its metamorphism are given."

Shimanovskii, S. V. Nabludenia nad temperaturnym rezhimom snezhnogo pokrova v IAkutske, Igarke i Podmoskov'e (Observations of temperature variations on the snow cover in Yakutsk, Igarka and suburban Moscow), p. 55-72. "Results of temperature measurements on and within the snow cover during the winter of 1942-43 in Yakutsk, in 1946-47 at Igarka and from Jan.-April 1950 near Moscow are reported and data are tabulated and graphed. Resistance thermometers were installed at various depths and standard maximum and minimum Hg thermometers placed on the snow surface for measurements. Many series of hourly measurements were made in addition to daily measurements at noon. The maximum snow depth was 35 cm. in Yakutsk, 75 cm. at Igarka and 88 cm. near Moscow. Important data characterizing the thermal properties of the snow cover and their variations with air temperatures and snow density were obtained. Studies on radiation absorption within the snow cover carried out at Yakutsk indicate that penetration of solar radiation at an albedo of 85-90 percent and 0.16 snow density was 32 percent through a 3-cm. snow layer and 1.5 percent through a 35-cm. layer."

Im-

Chekotillo, A. M. Temperaturnasa inertsifa pochvy v zimnee vremfa (Soil temperature stability in winter), p. 73-Effects of the depth and density of a snow cover on variations in soil temperatures are analyzed on the basis of observations in European Russia . . . Data on soil temperatures of various depths are tabulated for several winters and points, and compared with data on the snow-cover depth and density. The effects are expressed quantitatively by the index of soil-temperature stability at a fixed depth, which is defined as the duration of the period in which soiltemperature readings differ by not more than 0.2° C. Importance of stability in soil temperature for underground construction, especially pipe lines is noted.

Mel', M. I. K postanovke nabliudenii nad snezhnym pokrovom (Problems of snow cover observations), p. 98-111. The development of snow-cover observations in Russia, which began on a systematic basis in 1890, is reviewed; the observational methodology suggested in several manuals is outlined. Peculiarities of snow-cover distribution in open fields and grass-covered or forest-protected areas are analyzed. The recently adopted method of making snow surveys along a triangle does not sufficiently characterize the snow-cover distribution in open fields and in localities with broken relief; therefore this method is to be revised.

Shul'gin, A. M. O kharaktere raspredelenifa snezhnogo pokrova na poliâkh (Snow cover distribution on fields), p. 112-36. Deals with the importance of a snow cover as a source of soil moisture in the forest-steppe and steppe zones of the U. S. S. R., where the water equivalent of the snow cover reaches 25-30 percent of the annual precipitation; data are given on snow-cover distribution and soil-temperature variations in fields where the effects of snow retention were studied with grass, crops and other kinds of vegetation.

Shul'gin, A. M. Dinamika snezhnogo pokrova i vozmozhnosť sozdania ego ustoľchivosti v kontinental'nykh raľonakh (Dynamics of snow cover and the possibility of its stabilization in continental regions), p. 137-45. A secular trend and annual variation in snow-cover depth are discussed on the basis of observations in Barnaul from 1838, and the values are considered a descriptive index of the inland climate of Western Siberia. Decadal data on snow depth are tabulated and monthly depths during the winters from 1927-1947 are graphed. Snow usually covers inland areas of Western Siberia Nov.-April, with the maximum depth in Feb.-March. The dry snow falling at the beginning of winter drifts easily, so that fields retain only a thin snow cover and the soil freezes deep. Snowretention measures practiced in the area since 1941 have increased the snow depth on fields by a factor of 3-4 and reduced soil freezing and the destruction of winter The control of snowdrifts makes crops. possible a stabilization of the snow-cover depths.

Gongadze, D. N. Nekotorye voprosy dinamiki snezhnykh lavin (Problems in the dynamics of snow avalanches), p. 146-51. Conditions of avalanche formation and movement are mathematically analyzed on the basis of special studies in Georgia on the slopes of the Caucasus Mts. during 1949-1954, and the formulas derived are given.

Galakhov, N. N. Vlifanie lesoobrazufüshchikh porod na tafanie snezhnogo pokrova (Forest effects on snow melting), p. 152-72. Snow conditions in forested areas and forest effects on snow-cover distribution and melting are described on the basis of observations in European Russia since 1899 as well as special studies in Kalinin Province (1921-1930), Kola Peninsula (1935-40), Karelia (1942-1944), and near Moscow (1946-1948). Data for Moscow are tabulated and graphed. The distribution and melting of snow in forests depend largely on the The minimum depth of tree species. snow cover occurs under coniferous trees, which remain snow-covered through winter in the North and after falls of wet snow in the temperate areas. radiation from the tree trunk and intense absorption of solar radiation by the dark coniferous foliage result in snow melting on and around the trees even in winter. Spring melting starts in forests from the snow-free areas around the trees.-From SIPRE. Copy seen: DLC.

AKADEMIIA NAUK SSSR. 43530. LABORATORIÍA GEOLOGII UGLÍA. Materialy vtorogo ugol'nogo geologicheskogo soveshchaniîa. Moskva-Lenin-Izd-vo Akademii nauk SSSR, grad, 1956. 2 v.: 260, 618 p. illus., diagrs., tables, maps incl. fold. (Akademifa nauk SSSR. Laboratorifa geologii uglifa. Trudy, 1956, vyp. 5 and 6.) Text in Title tr.: Materials of the Second Coal-geology Conference.

The Conference, attended by over 600 representatives of government agencies and scientific institutions dealing with geological exploration, prospecting and mining, took place in Leningrad, at the Laboratory of Coal Geology of the Academy of Sciences, Mar. 21–26, 1955. Of 101 papers and 13 reports delivered to the Conference, 84 papers are presented in these volumes, some with summary of subsequent discussion. Resolutions relating to the needs of exploration in various coal-bearing areas, including Northern Ural, Tungusskiy and Lenskiy coal basins were passed (vyp. 6, p. 593–604).

Lists of participants (ibid., p. 605-615) includes 27 representatives of the Scientific Research Institute of Geology of the Arctic. Address by E. T. Shatalov and papers by S. N. Tŵremnov, E. A. Perepechina, M. T. Ritenberg, M. A. Speranskii, V. V. Pogorevich, A. V. Makedonov, K. G. Volnovskii-Kriger, M. K. Korovin and A. S. Strugov, relating at least in part to the coal-bearing regions of the North, appear in this bibliography under their authors' names.

43533. AKHUMOV, E. I. O pererabotke morskol vody v uslovifakh kholodnogo klimata. (Zhurnal prikladnol khimii, Apr. 1956. t. 29, vyp. 4, p. 569-77, tables, graphs.) 6 refs. Text in Russian. Title tr.: Desalination of sea water under cold climate conditions.

The process of extracting salt from sea water (from freezing to  $-10^{\circ}$  C.) is analyzed in detail. Methods of computation of the salinity of the ice layers, water concentrate and their chemical composition are described. Data are tabulated and graphically presented. Variations in the physical properties of sea-water ice, depending on initial salinity, are given. This method of desalination is considered effective for the industrial water supply of regions with long, severe winters.—From SIPRE.

43538. ALAMPIEV, P. O setke ėkonomicheskikh raionov SSSR. (Planovoe khozîaIstvo, 1956, no. 6, p. 25-37) Text in Russian. *Title tr.:* The network of economic zones of the U.S.S.R.

Unusual features in the economy in the Asiatic North are noted (p. 35-37): the vast area (8 million sq. km.), scarcity of population, lack of transportation, impossibility of agriculture, a local economy based on hunting and raising reindeer. That area must be considered as a unique economic zone, requiring a special approach in planning its development. Copy seen: DLC.

43539. ALASKA. CONSTITUTION. The Constitution of the State of Alaska. [College, Alaska.], Feb. 5, 1956. 55 p. fold. map.

Contains text of this Constitution, agreed upon by the delegates to the Alaska Constitution Convention, Feb. 5, 1956, at the University of Alaska. The 15 Articles deal with: declaration of rights; legislature; executive; judiciary; suffrage and elections; legislative apportionment; health, education and welfare; natural resources; finance and taxation; local government; initiative, referendum, and recall; general provisions; amendment and revision; apportionment schedule; schedule of transitional measures. Appended is text of ordinances on: ratification of Constitution, Alaska-Tennessee Plan, abolition of fish traps; the second providing for election of senators and representatives to Congress in advance of Alaska's admission as a state of the Union.

**43540.** ALASKA. DEPT. OF MINES. Report of the Commissioner of Mines for the biennium ended December 31, 1956. Juneau, 1957. 103 p. 6 tables.

Contains information on administration, cooperation with federal agencies; field investigations, assay offices and field stations; new activities and services; mineral production during 1954-1956, average metal prices; future and needs of industry; prospecting and exploration (claims staked by division and year); mining of precious metals (by district), coal, base metals, radioactives, nonmetallics, oil and gas; laws and regulations pertaining to locating and leasing ground; employment and accidents at mines; active mining operations during 1955-1956. Previous reports are listed as No. 33185 of Arctic Bibliog-Copy seen: DGS. raphy.

43541. ALASKA. DEVELOPMENT BOARD. Alaska passenger traffic survey 1955. Juneau, Aug. 1956. 13 p. 9 graphs, 4 tables.

An annual compilation (since 1950) based on information supplied by steamship lines, scheduled airlines, Territorial Dept. of Police, and Canadian Dept. of Citizenship and Immigration (Alaska Highway); also, for the first time, Military Sea Transportation Service (MSTS): data on its civilian traffic. Passenger traffic for 1955 was 254,590, a decline of 0.6 percent from 1954. Continuing a trend started in 1954, departures exceeded arrivals by 5,598 persons. Data on each type of travel, airline, steamship, and highway are graphed, tabulated and briefly discussed. During 1955. airlines carried 62.3 percent of total highways 29.4 percent, and traffic, steamships 8.3 percent.

43542. ALASKA. DEVELOPMENT BOARD. Estimate of Alaska population, July 1, 1954 to June 30, 1955. Report no. 4. Juneau, 1956. 10 p. 2 graphs, 3 tables.

Fourth such report (cf. No. 38485) offers detailed estimates for military and civilian population by month, July 1954–June 1955; and for civilian only, July-Dec. 1954. Annual data Oct. 1, 1939–July 1, 1955, also monthly Jan. 1950–Jan. 1956 are added. The downward trend, started in fiscal 1954 with a net loss of 355 persons, increased to a net loss of 2,274 in fiscal 1955. The annual winter migration from Alaska was, however, less than ever before.

Copy seen: DI.

43543. ALASKA. DEVELOPMENT BOARD. Financial data regarding the incorporated towns and cities of Alaska, 1955. Juneau, Apr. 1956. 10 p. 2 graphs, 5 tables.

Contains results (with brief discussion) of third financial survey of 30 municipalities (five not reporting): judicial division, incorporation date, class; property assessments and tax rate: bonded indebtedness; sales tax; number and value of building permits issued, 1951-1955. Total assessed valuation of real and personal property is given for each year 1935-1955. That for 1955 \$258,254,470, an increase of \$34,219,354 or 15.3 percent over 1954, due partly to reassessment program in Juneau, the true increase being nearer \$19 million. Property valuation is still rising, but at a declining rate. Anchorage, Fairbanks, Juneau, and Ketchikan account for 77 percent of total property value. Previous report, No. 38486.

**43544. ALASKA. GOVERNOR.** Annual report 1955. Washington, D. C., U. S. Govt. Print. Off., 1956. 97 p.

Governor Heintzleman's review of the fiscal year July 1, 1954–June 30, 1955, with information on work of federal and territorial government departments, civil defence, finances, fisheries, health and welfare, transportation, future plans, etc. Earlier reports are listed under No. 38475.

Copy seen: DLC.

43545. ALASKA. GOVERNOR. A handbook on Alaska regionalism for the

use of delegates to the Alaska Constitutional Convention, College, Alaska. Prepared by George W. Rogers, Office of the Governor. Juneau, 1955. 9 1. 8 text maps, 2 tables. Mimeographed.

Approx. 15 refs.

Data assembled to aid delegates in devising systems of apportionment and local government and in determining policy in relation to natural resources management, economics and public administration. Sketch of the geographic regions is followed by analysis of four socio-economic sections: their population characteristics (1950 census statistics), economic structure (statistics for 1949-1953), communications and transportation, their administrative units. Maps show their boundaries, also forest distribution and forest management districts, mineral deposits, judicial divisions and recording districts, fur districts and commercial fisheries areas.

Copy seen: DLC.

43546. ALASKA. GOVERNOR. Index: federal government and territorial government. Juneau, Mar. 12, 1956. [3], 10 p. Mimeographed.

Directory of U. S. Government departments and their agencies in Alaska and of the Territorial departments and agencies. Principal officials, address, etc., are included for each dept. or agency.

43549. ALASKA COMMITTEE FOR THE WHITE HOUSE CONFERENCE ON EDUCATION. Report of Alaska White House Conference on Education. 1956. v, 19, ii, 48 p.

A ten-member committee appointed by Governor Heintzleman represented Alaska at the nation-wide conference on education, Washington Nov. 28-Dec. 1, 1955. Six reports from that conference, on aims, organization, building needs, teachers, finance, and public interest, are given (19 p.). Appended (48 p.) are data on these topics assembled in advance by the Alaska Committee with aid of local school boards, parent-teacher groups, etc. They offer a comprehensive survey of Alaskan schools with specific local information. The committee's plan for invoking this participation is outlined in introduction, together with a précis of the Territorial school organization.

43556. ALBERT, SALOMON NAPHTALI, 1916–, and J. F. FAZEKAS. Cerebral hemodynamics and metabolism during induced hypothermia. (Current researches in anesthesia and analgesia, 1956. v. 35, no. 4, p. 381–85, table.) 13 refs.

Account of study made on five patients undergoing refrigeration anesthesia, with body temperatures reduced by 3° to 13° C. A moderate to marked reduction of cerebral blood flow, oxygen delivery, and metabolism, coupled with increased cerebral vascular resistance, were observed.

Copy seen: DNLM.

4357. ALBERTA SOCIETY OF PETROLEUM GEOLOGISTS. Lexicon of geologic names in Alberta and adjacent portions of British Columbia and Northwest Territories. Calgary, 1954. [172] p. Mimeographed. Approx. 50 refs. Supplement, Aug. 31, 1955 (21 p.).

Lists 173 stratigraphic units: group, formation, member, etc., including 21 in the Supplement which completes the planned compilation. For each, is given name, author, type locality, history of former names (if any), lithologic characteristics, thickness and distribution, relation to other units, and references. Some names apply to Mackenzie District.

Copy seen: DLC.

43558. ALCOCK, FREDERICK JAMES, 1888— . Zinc and lead deposits of Canada. Ottawa, King's Printer, 1930. 406 p. illus., maps (3 fold.), cross-sections, debles. (Canada. Geological Survey. Economic geology series, no. 8.) Approx. 100 refs.

Includes brief description of regional geology of northern Canada with reference to lead and zinc deposits; then notes occurrences on east coast of Hudson Bay between Richmond Gulf and Little Whale River (p. 131); Reindeer Lake, northern Manitoba (p. 216–17); Great

Slave Lake, Mackenzie District, by J. M. Bell (p. 219–24); Mayo District, Upper Beaver River region, Dawson, Sixtymile, Windy Arm (Bennett-Tagish Lake region), and Wheaton Districts, Yukon, by W. E. Cockfield (p. 226–61); also Copper, Chistochina, and Nabesna River regions, Alaska (p. 359).

43559. ALCORN, GORDON DEE, 1907-

. Alaska Lapland longspur, a spring sight record at Westport. (Murrelet, May-Aug. 1956. v. 37, no. 2, p. 22.)

Contains a record of Calcarius lapponicus alascensis, an adult male, observed feeding among drift logs, on May
5, 1950. It is a very rare bird within the
limits of Washington State, especially in
spring time.

Copy seen: DSI.

43560. ALDRICH, HARL P., Jτ. Frost penetration below highway and airfield pavements. (National Research Council. Highway Research Board. Bulletin, 1956. no. 135, p. 124–49, 3 text maps, diagrs., graphs, 3 tables.) 16 refs.

Fundamental principles relating to frost penetration into the ground are outlined and a rational method is offered for computing its maximum depth below highway and airfield pavements. Methods are presented also for making quick preliminary predictions of frost penetration, and "design" procedures, based on thermal properties of the soil and weather conditions at the site; cases requiring "exact" solution are referred to numerical and analogue computer Status of current research solutions. related to heat transfer between the airpavement interface by radiation and convection-conduction is discussed. pended is "derivation of a rational formula for the prediction of frost penetration," by the writer and H. M. Paynter .-From author's abstract.

Copy seen: DGS.

**43561. ALDRICH, JOHN MERTON. 1866–1934.** An entomologist in Alaska. (Washington Academy of Sciences. Journal, May 19–June 4, 1922, v. 12, no. 10–11, p. 253, 274.)

Recounts trip to Alaska in summer 1921, with notes on faunal region and collecting of insects. The abundance of mosquitoes, horseflies and other blood-sucking flies is stressed, and the apparent absence of the house fly also noted. The relations of the fauna are with the Canadian zone of the northern part of the U. S.; another

element follows the Pacific Ocean southward, and no doubt other elements extend to Greenland and westward across Siberia. Copy seen: DLC.

43562. ALDRICH, JOHN MERTON, 1866-1934. North American two-winged flies of the genus Cylindromyia Meigen (Ocyptera of authors). (U. S. National Museum. Proceedings, May 29, 1926. v. 68, art. 23, no. 2624, p. 1-27, plate.)

Contains a discussion and history of the genus, a key to the species and descriptions of 13, of which nine are new. C. dosiades (p. 8-9) is recorded in Rampart, Alaska.

43566. ALEKSANDROVA, V. D. Rastitel'nost' f\(\tilde{\text{Uzhnogo}}\) ostrova Novoi Zemli mezhdu 70°56' i 72°12' s. sh. (Rastitel'nost' Krainego Severa SSSR i ee osvoenie, 1956. vyp. 2, p. 187–306, illus., tables, maps.) Approx. 150 refs. Text in Russian. Title tr.: The vegetation of the southern island of Novaya Zemlya between 70°56' and 72°12' N.

Monographic study based partly on the author's investigations in 1931-1933 (cf. The physical conditions: geomorphology, climate, seasonal changes, geological formations and soils are outlined (p. 192-213); the flora and plant associations of various parts of the island are described in detail, with emphasis on utilizing vegetation for reindeer pastures. Latitudinal and vertical zoning is discussed; the lichen-, small shrub- and grass tundras, are characterized, as are grass-, grass-moss- and moss marshes, also polar deserts: three belts of the mountainous area (to 200 m., 200-300 m., and over 300 m. altitude), are sketched. Gusinaya Zemlya is described in six zones, Mezhdusharskiy Island in five and the Kara seacoast between Savina and Abrosimova Rivers in four zones. Together these summer and winter pastures are capable of feeding 3,000-4,000 reindeer. A summary (27 tables) of the plant associations is added, and the plants mentioned throughout the paper are included (Latin names) in the cumulative index of the volume, p. 498-509.

43568. ALEVA, GERARDUS JACOBUS JOHANNES. The fragment bearing gneissose rocks of the Gabbi-Mesket region, Swedish Lapland. (Geologiska föreningen, Stockholm, Förhandlingar, 1951. bd. 73, häfte 2, no. 465, p. 200–204, diagr.) 4 refs.

Reply to Kautsky's review of No. 43569, dealing with differences of opinion. Apparently the rocks, on the one hand a polymict conglomerate and on the other a series of fragment-bearing gneissose rocks, believed to be compared, are actually quite dissimilar in nature and origin. The author suggests for the particular section of the mountains where the gneissose rocks are found, an hypothesis which involves shoving, shearing, fragmentation, faulting, intrusion, metamorphism, and partial melting of wall rock, which is the presently considered fragment-bearing outcrop.

Copy seen: DGS.

43569. ALEVA, GERARDUS JACOBUS JOHANNES. Geology and petrology of the Gabbi-Mesket region, Swedish Lapland. Academisch Proefschrift, Universiteit van Amsterdam. Assen, Van Gorcum, 1950. 158 p. 60 illus., 4 maps (Amsterdam, Universiteit, Geologische Instituut, Mededeling no. 164) 32 refs. Summary in Dutch.

The Gabbi-Mesket region, in Sorsele parish in Västerbotten (approx. 66°-66°10′ N. 15°10–15°30′ E.) has no permanent habitations or paths, although

permanent habitations or paths, although there are a few Lappish shelters. Relief is moderate, ranging from ca. 600-1400 m. The minor landscape elements are the results of glacial deposition and the erosive activity of valley glaciers. There are hanging valleys, cirques, glacial lakes, and unintegrated streams, among other features, along with the bedrock surface, only occasionally covered with loose earth and moor vegetation. Treatment of the bedrock is divided into geological outline, description of the geologic units, petrography and petrology, and general considerations of metamorphism, migmatization, instrusion, gneissic develop-

ments, folding, and thrusts. Reviewed

by Gunnar Kautsky in Geologiska föreningen, Stockholm, Förhandlingar, 1950, bd. 72, häfte 2, no. 461, p. 228–30. Copy seen: DGS.

43570. ALEXANDER, CHARLES PAUL, 1889- . New species of two-winged flies from western North America belonging to the family Tipulidae. (U. S. National Museum. Proceedings, Mar. 11, 1924. v. 64, art. 10, no. 2500, p. 1–16.)

Includes descriptions of six new species and one new subspecies from Alaska and southern Alaska. **Copy seen:** DLC.

43571. ALEXANDER, CHARLES PAUL, 1889 - . Two new crane-flies from Point Barrow, Alaska. (Pan-Pacific entomologist, July 1956. v. 32, no. 3, p. 123–25.)

Describes: Prionocera gracilistyla n. sp. and Pedicia (Tricyphona) hannai antennata n. subsp. collected in summer 1950, by N. A. Weber. Copy seen: DA.

43572. ALEXANDER, CHARLES PAUL, 1889 - . Undescribed species of craneflies from the eastern United States and Canada; Dipt.: Tipulidae. Pts. X, XII. (Entomological news, Dec. 1946, v. 57, no. 10, p. 245–52; (XII) July 1956, v. 67, no. 7, p. 177–95.)

Four new species are described in pt. X, of which Tipula (Arctotipula) thulensis n. sp. is recorded in Northwest Territories, Baffin Island, Clyde River, 70° N. In pt. XII, descriptions are given of a new subspecies, including Tipula (Vestiplex) breviligula n. sp. from Cape Henrietta Maria, Hudson Bay, Ontario, also T. (Arctotipula) tribulator n. sp., and D. (Dicronota) clementi n. sp. both from northern Quebec. Of this series, the other parts (I-IX, XI, XIII) do not contain arctic material.

Copy seen: DA.

43573. ALEXANDER, ROBERT G. Arctic locomotives. (Military engineer, Mar.-Apr. 1956. v. 48, no. 322, p. 104-105, illus.)

Contains results of tests made in Greenland with special tractors for sled trains. The first diesel models with track shoes 36 in. wide were modified after tests in 1953-54 into larger units incorporating a torque converter and lower ground pressure. These modified tractors were tested on powder snow with ladder tracks of round tubular grousers

under a ski 36 in. wide, and with conventional grousers 36 in. wide. Maximum drawbar pull with the ladder track grouser was 15,000 lb. in second gear without slippage. The tractors could not turn with a load requiring more than 7500 lb. drawbar pull. Suggestions for further improvements are made.

43580. ALLAN, JOHN DONALD, 1915—. Geology of the Hughes Lake area, Granville Lake division, Manitoba. Winnipeg, 1948. 15 p. fold. map 16 x 21 in., table. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Preliminary report 47–3) 2 refs.

Map (scale 1 in.: 1 mi.) covers the area 56°45′-57° N. 100°30′-45′ W. in the

Lynn Lake region. Geological mapping was carried out June-Sept. 1947. Physical features are described. Bedrock is Precambrian. Oldest is the Archean Wasekwan series of interbedded volcanic and sedimentary rocks, unconformably overlain by the Sickle series of conglomerate and quartzose sediments. formations are intruded by igneous rocks ranging from gabbro to granite. rocks are highly folded and metamorphosed, and evidence of faulting is widespread. Exploration for nickelbearing ore-bodies and for gold is described. No deposits of economic importance have been found.

43581. ALLAN, JOHN DONALD, 1915— Lynn Lake area; notes to accompany preliminary map 46–2. [Winnipeg, 1946?] 3 p. fold. map 30 x 42 in. Mimeographed. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Preliminary report 46–2)

Map (scale 1 in.: ½ mi.) covers the area 56°45′-57° N. 101°00′-15′ W. The central and southern parts, underlain by the early Precambrian Wasekwan series (pre-Sickle) of interbedded volcanic and sedimentary rocks, are described; structural interpretation is given. Extensive areas of post-Sickle granitic rocks and a sedimentary gneiss, schist and granite complex occupy the northern map-area. Nearly all rocks are cut by small granite, porphyry, and felsite intrusions. Occurrences of nickel and copper and preliminary development by Sherritt Gordon Mines Ltd. are noted.

43582. ALLEN, C. F., and S. W. MIL-LER. Seismic measurements on the Greenland Ice Cap. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954. p. 351–74, illus., maps incl. 1 fold., graphs, diagrs., 1 fold.) 4 refs.

"Seismic soundings were made between Thule Ramp and Point X, a distance of 320 mi. by weasel. Seismic velocity computations using the 'delta t' method placed the seismic velocity in ice at 12,500 ft./sec. ±200 ft./sec. Ice thickness along the party route varied between 500 ft. near Thule Ramp and 8080 ft. at Point X. The bedrock profile is very irregular as far east as Alpha. Beyond this point the bedrock surface has less relief and slopes generally down to the east. More work is necessary in the marginal zone before a

map of the bedrock topography can be made. The route is mapped, and seven cross-sectional profiles are given."—Authors' abstract.

43600. ALTER, AMOS J. Alaska water pollution control investigations. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 19–20.)

Comprehensive physical, chemical, and biological investigations of the waters of Alaska were initiated by the Alaska Water Pollution Board in the summer of 1951. Ward Cove near Ketchikan was the site for the first attempt to evaluate water assets and liabilities in Alaska: year-around observations were begun on (1) types and numbers of marine plants and animals; (2) water temperature, turbidity and color; (3) tidal movement and exchange; (4) freshwater discharge into the cove; (5) type and strength of wastes entering the cove; (6) initial dissolved oxygen, percent oxygen saturation and five-day biochemical oxygen demand; (7) most probable numbers of coli-form bacteria; (8) total, dissolved, ignited, and ignited dissolved solids; (9) pH, chlorides, sulphates, iron, magnesium, and calcium. A summary of the results obtained is included.

**43601.** ALTER, AMOS J. Thermodynamic considerations in the design of Alaskan water distribution systems. (*In:* Alaskan Science Conference . . 1953. Proceedings, pub. 1956, p. 36–38.)

Problems inherent in community water systems designed for areas where the mean annual temperature is below freezing and some remedies are described. Potable water supplies are usually heated at the source or heated by some means at points throughout the system. Most failures have been due to one or more of the following: water supercooling with frazil ice formation, damage from seasonal frost, poor drainage, structural failure due to permafrost thawing, complicated operating features, and uneconomical design features. To operate satisfactorily, the system must be de-

signed to provide a positive heat balance with heat losses controlled to maintain structural stability.

43619. ANDERSEN, HAROLD ERNEST, 1916- . Climate in Southeast Alaska in relation to tree growth. Juneau, June 1955. 11 p. 3 text maps, 3 tables. Mimeographed. (U. S. Forest Service. Alaska Forest Research Center. Station

paper, no. 3.) 11 refs.

Data on climatic factors vital to tree growth are assembled with view to increased interest in Iceland (where Sitka spruce is being grown from Alaskan seed) and in northern Europe. Data are summarized from Weather Bureau records on precipitation, mean temperature of growing season and coldest part of the year, number of frost-free days. Rainfall in Southeast Alaska is probably excessive

for optimum tree growth. Best sites are on well-drained areas. Low temperature during growing season may be limiting factor in growth. Copy seen: DWB.

An improved antenna system was designed for the transmitter stations of the Arctic Ionosphere Research Detachment. The new antennas were installed on the 4095- and 12,305-ke stations at Northway and on the 7940-kc station at Sheep Mountain. Equipment was built and tested for determining the fade rates of the echoes which are detected to the magnetic north of College. It is concluded that first echoes are caused by direct scatter from the aurora, and that second echoes which occur at ranges equal to or slightly greater than twice the first are caused by a forward scattering of the almost-horizontally-ionized signal by clouds which are located at or near the aurora.

**43627.** ANDERSON, ANTON A. Railroad location in Alaska. (*In:* Alaskan Science Conference . . . 1953. Proceedings, *pub.* 1956, p. 25–36)

Problems peculiar to locating railroads in Alaska and the arctic environment are generally overlooked by engineers with experience limited to temperate climates. The tundra muck which exists in nearly all areas accessible to railroads must be removed entirely or fills placed on the natural ground cover with a minimum of disturbance. Location must be chosen to minimize snow drifting and snow slides. Care must be taken to locate above the high water mark and the level of ice reached during heavy jams. A railroad location party in Alaska should comprise about 20 men. Surveying procedures and precautions are outlined. Copy seen: DGS.

43631. ANDERSON, LOIS C. The standard deviation as a measure of variability of monthly mean temperature in the Northern Hemisphere. Natick, Mass., July 1955. iv, 42 p., diagr., tables, maps incl. 1 fold. (U. S. Quartermaster Corps. Environmental Protection Division. Technical report EP-16.) 8 refs.

"Maps of the variability of mean monthly temperature in the Northern Hemisphere are presented, accompanied by a brief description of their construction. Examples of several applications are given. The theory on which these applications are based is that this method should yield an accurate estimate of expected temperatures within the limitations stated. Comparison of expected with actual values for one station indicates that the estimate is reasonably accurate. Some general conclusions that may be drawn from an examination of these maps are: (1) Departures from the long-period mean are larger in winter than in summer. (2) Departures from the mean are small in tropical regions. (3) Departures from the mean in high latitudes during winter are much larger in certain regions, such as the Yukon, than in others at the same latitude. (4) In regions where variation from year to year is high, military planners must evaluate the risk of deviation from the average in determining requirements imposed by these varying conditions."—QRDC summary and conclusions. Microcard available.

43632. ANDERSON, LUDLOW G., and P. R. MOYER. Blasting in surface and drift operations in the far North. [Washington, D. C.] 1956. 3 p. (In: U. S. Office of Naval Operations. The dynamic North, v. 2, chap. 4.)

The use of explosives in frozen ground and permafrost is reviewed briefly. Improvements in explosives and refinements in their use have resulted in an increase in their application to mining purposes in the Arctic. The addition of nitro-substitution compounds to nitro-glycerin lowers its freezing point. The use of water for thawing the frozen overburden at one coal-strip mine is described.

Copy seen: DLC.

43633. ANDERSON, PAUL A. Low temperature synthetics. (Aero digest, Dec. 1942. v. 41, no. 6, p. 184, 279, illus.)

Discusses the requirements for low-temperature synthetics. A synthetic rubber flexible at -70° F. is being developed by using freeze-resistant Neoprene-type synthetic compounds which are designed to be as soft as is consistent with the mechanical usage to which the synthetic will be placed. Softer type stocks were selected because the hardening curve was gradual. Copy seen: DLC.

43634. ANDERSON, RUDOLPH MARTIN, 1876— Recent zoological explorations in the western Arctic. (Washington Academy of Sciences. Journal, June 4–19, 1919. v. 9, no. 11–12, p. 312–14, 356–57.)

Contains review of the author's zoological exploration along the coast from Point Barrow, Alaska, to Coronation Gulf, and regions inland, notably on both sides of Endicott Mts. divide. Difficulty of transportation, limited fauna in winter and limited scope for field work in summer are noted. A great diminution of some forms of bird life in the Arctic in recent years and reduction of game and fur animals, due principally to white man's influence, are stressed. These observations were made on the Stefans-

son-Anderson Expedition of the American Museum of Natural History 1908–1912. Copy seen: DLC.

43635. ANDERSSON, B., and others. Central control of heat loss mechanisms in the goat. (Acta physiologica scandinavica, 1956. v. 37, fasc. 2–3, p. 261–79, illus.) 10 refs. Other authors: R. Grant and S. Larsson.

The existence of a discrete "heat loss center" is demonstrated, its location and extent described, and the effects of its stimulation studied. Exposure to cold or lowering the body temperature by introduction of cold water into the stomach increased the voltage threshold for producing responses to stimulation of the center. Repeated stimulation of the center lowered body temperature especially in animals exposed to cold. Cold exposure increased the latencies and decreased the duration of "after effects." The effects of stimulating the caudo-ventral part of the center are also discussed. Copy seen: DNLM.

43636. ANDERSSON, GUNNAR. Om talltorkan i öfra Sverige våren 1903. (Stockholm, Statens skogsförsöksanstalt, Meddelanden, 1905. Häfte 2, p. 49–80, 7 illus., fold. map., table) Text in Swedish. Summary in German. *Title tr.*: On withering of pine in upper Sweden in the spring of 1903.

Dessication of shoots on young pine, especially evident in 1903 and believed to be due to climatic conditions, was investigated. Distribution and nature of effect are summarized. Geographic, local, and age differences were considered, also conditions surrounding the individual trees. Unreadiness for winter, cold conditions of ground that prevented proper root feeding, and other biological conditions are suggested as factors in the tree damage. Pine in northern Sweden is near limit of growth and small changes in climate have strong effects.

43641. ANDJUS, RADOSLAV K. Effect of hypothermia on the kidney. (*In*: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia . . . symposium, Oct. 1955, *pub*. 1956. p. 214–20, illus.) 2 refs.

Report and discussion on electrolyte excretion, and reabsorption capacity of renal tubules, as affected by hypothermia. It is concluded that cold has a direct inhibitory effect on the reabsorption activity of the tubules. In the range of 18° to 23° C. sodium reabsorption was completely inhibited, while glomerular filtration and urinary flow were still present.

he g, 43642. ANDJUS, RADOSLAV K., and others. Effects of hypothermia on behaviour. (Nature, Nov. 1955. v. 176, no. 4491, p. 1015–16.) 10 refs. Other authors: F. Knöpfelmacher, R. W. Russell and A. U. Smith.

Contains report on experiments with rats made hypothermic to 13.4°–18.5° C., and to the freezing point. The latter group showed a significant impairment in problem-solving performance. In neither group was memory notably affected. No effect on other aspects of behavior tested, was observed.

Copy seen: DNLM.

43643. ANDJUS, RADOSLAV K., and A. U. SMITH. Reanimation of adult rats from body temperatures between 0° and +2° C. (Journal of physiology, June 1955. v. 128, no. 3, p. 446-72, illus., tables.) 49 refs.

Contains description of a modification of Andjus' original method, including rewarming with a beam of light focused at the precordium and resulting in revival of 75 percent of animals. The deeply chilled animals were without circulation or respiration for 40 min. or longer; 58 of these rats were studied from 66 to 630 days; normal behavior and growth usually returned four to seven days after revival; males and females tested for fertility had progeny three months after reanimation. Colonic and thoracic temperatures, arterial blood pressure, O<sub>2</sub> consumption and blood sugar concentra-

tion were recorded during cooling and rewarming. Copy seen: DLC.

43644. ANDJUS, RADOSLAV K., and J. E. LOVELOCK. Reanimation of rats from body temperatures between 0° and 1° C. by microwave diathermy. (Journal of physiology, June 1955. v. 128, no. 3, p. 541–46, illus., table.) 5 refs.

Using microwave diathermy for rewarming, the authors succeeded to revive 80-100 percent of animals cooled to a near-zero temperature. Local burns caused by earlier methods were largely responsible for the secondary delayed deaths.

43645. ANDJUS RADOSLAV K., and others. Resuscitation and recovery of hypothermic, supercooled and frozen mammals. (In: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia... symposium Oct. 1955, pub. 1956. p. 125-45, illus. table.) 17 refs. Other authors: J. E. Lovelock and A. U. Smith.

Summary of sound film made at the National Institute for Medical Research, London, under the supervision of the authors. This is followed by addendum of A. U. Smith on: Formation of ice in tissues; and an extensive one (p. 129-42) of R. K. Adjus on: Closed container cooling, and observations on the physiology of cooling and resuscitation. The physiology of hypothermic states, the range of active defense, of cold-narcosis and suspended animation are dealt with. After-effects including those of repeated cooling are also discussed.

Copy seen: DLC.

43646. ANDJUS, RADOSLAV K. Suspended animation in cooled, supercooled and frozen rats. (Journal of physiology, June 1955. v. 128, no. 3, p. 547-56, illus., tables.) 13 refs.

Contains a study of the limits of suspended animation, the effects of cooling to below zero and of repeated cooling to zero. Ten out of ten animals survived suspended animation of 60–70 min., but only one out of ten survived when this period was extended to 100–110 min. Rats were cooled to 0° C., up to ten times; an adaptation of recovery and growth time in these animals was observed and recorded. Animals supercooled to about 3° C. colonic temperature, revived and recovered completely.

43648. ANDREEV, VLADIMIR NI-KOLAEVICH, 1889— Deshifrirovanie po aėrofotosnimkam razlichnykh tipov tundr i ikh aėrovizual'nafa kharakteristika po moroznoľ treshchinovatosti. (Geograficheskoe obshchestvo SSSR. Geograficheskiľ sbornik, 1955, no. 7, Voprosy aėrofotos''emki, p. 103–120, illus., diagrs., table.) 13 refs. Text in Russian. Title tr.: Interpretation of aerial photographs of various tundra types and their characteristics due to frost cracking, as seen from the air.

Three main types of tundra microrelief are distinguished: low arctic polygonal marshes, peat tundra marshes, and rocky ground tundras. Each type is classified into various morphological subtypes. Their plant associations and effects of frost cracking are outlined, and interpretation of their aerial photographs is discussed. In some tundra regions, 50-80 percent of the surface is affected by frost cracking. Air photographs (13) taken by the author at 300-600 m. in various tundra regions of U. S. S. R. are reproduced to show patterns of main types and subtypes of tundra terrain.

43651. ANDREEV, VLADIMIR NIK-OLAEVICH, 1889 . Zaselenie tundry lesom v sovremennuû ėpokhu. (Rastitel'nost' Krainego Severa SSSR i ee osvoenie, 1956. vyp. 1, p. 27–45, illus., map.) 66 refs. Text in Russian. *Title* tr.: Forest penetration of the tundra in the present epoch.

The northern tree line has been considered in southward retreat (by G. I. Tanfil'ev, B. N. Gorodkov, A. I. Tolma-chev, IU. D. TSinzerling, and others), leaving in the tundra only derelict forest remains in the form of small thin groups of trees. The view has been advanced recently (by V. N. Sukachev, A. A. Grigor'ev, L. N. Tûlina, and others) that, on the contrary, due to a general amelioration of climate, the forest is advancing northward, and the small groups of trees in the tundras are pioneers preparing soil for the expanding forest. The latter theory is supported by results of the author's observations in Bol'shezemel'skaya and Malozemel'skaya Tundras, in the Cheshskaya Guba region, etc. Three stages of forest advance are distinguished and shown in photographs. The present and former tree line in European U. S. S. R. (Arkhangel'sk Province) is indicated (map); extensive literature (66 items) on the subject is cited. Copy seen: DLC.

ANDRULIONIS, E. P. Shire 43670. primensat' patrul'nusu snegoochistku na mestnykh dorogakh. (Avtomobil'nye dorogi, Mar. 1956. god 19, no. 3 (161), p. 12.) Text in Russian. Title tr.: Regular snow-removal on local roads must be expanded.

Formation of snow rolls on the road sides from heavy snow removers increases accumulation of drifts. Snow patrols, equipped with light, fast-moving (15 m. p. h.) and maneuverable snow plows are able to keep the road clear of rolls and drifts. Copy seen: DLC.

43671. ANDRUSHENKO, P. F. O fatsii manganitovykh rud v Polunochnom mestorozhdenii na Severnom (Akademiîa nauk SSSR. Izvestiîa, Seriîa geologicheskaîa, Mar.-Apr. 1950. no. 2, p. 139-45, graph, illus.) Text in Russian. Title tr.: Phases of manganite ore deposits in the Polunochnoye of the Northern Ural.

Manganese deposits in the Polunochnoye (60°50' N. 60°30' E.) were found in 1920, but detailed mineralogical investigations were conducted only recently. Rock specimens, collected from different layers of the deposits, were studied with contemporary methods, including X-rays and spectral analysis. A considerable mass of ore was indicated. Results of the study are given in a table and microphotographs. Two phases of the ores are identified: primary oxide and carbonate ores. The first phase is subdivided by composition and phosphorus content into pyrolusite (manganese dioxide) and manganite. Their characteristics are described in detail.

43682. ANRICK, CARL JULIUS, 1895—, and O. THANING. Adelig öfning och annat; anteckningar om stormakstidens svenska geografi. (Svenska turistföreningen, Stockholm. Årsskrift, 1950, p. 253–66, 6 text maps) Text in Swedish. Title tr.: Noble practice and otherwise; notes on Swedish geography during its period as a power nation.

Geography books of the 16th century afford a means of surveying the country as well as the status of geography and its teaching at the time. Lapland was described as a wild and uninhabited land. No place names are found on the map inland from the Bothnian coast.

Copy seen: DGS.

43683. ANRICK, CARL JULIUS, 1895 - , Editor. En höstkrönika. (Svenska turistföreningen, Stockholm. Årsskrift, 1954, p. 28–43, 6 illus., 9 text maps.) Text in Swedish. Title tr.: An autumn chronicle.

Monthly account of the changing season, from August in Lapland and to January in Skåne where real winter is short. Maps show distribution of average dates for departure of birds, the beginning of harvest of several crops, ripening of lingonberries, seeding of rye, falling of birch leaves, end of the vegetation period, first snowfall. Incidents taken from various sections of the country provide an overall view of the change from summer to winter.

Copy seen: DGS.

43684. ANRICK, CARL JULIUS, 1895- , Editor. En sommarkrönika. (Svenska turistföreningen, Stockholm. Årsskrift, 1953, p. 25–40, 7 illus.) Text in Swedish. Title tr.: A summer chronicle.

Summer, when the daily average temperature is above 10° C., is considered as foresummer, high summer, and late summer. In the northern Swedish upland, summer temperature obtains approx. July 12-Aug. 5, with only a few days above 15° C. Time variations in vegetative growth from north to south are discussed.

\*Copy seen: DGS.

43685. ANRICK, CARL JULIUS, 1895– , Editor. Vårens krönika. (Svenska turistföreningen, Stockholm. Årsskrift, 1952, p. 31-44, 6 illus.) Text in Swedish. Title tr.: Spring chronicle.

First signs of spring appear in late February in southern Sweden, and late April in Lapland. Early signs in Lapland are the longer daylight and crust formation on the snow; about May 1 average temperature rises above freezing, ground becomes bare about mid-May, and in late May the birches are green in central northern locations. Ice lies on Torneträsk until mid-June.

43686. ANRICK, CARL JULIUS, 1895-, Editor. En vinterkrönika. (Svenska turistföreningen, Stockholm. Årsskrift, 1955, p. 19–32, 5 illus., diagr., 6 maps.) Text in Swedish. Title tr.: A winter chronicle.

Winter, the time when average daily temperature is below the freezing point, varies greatly in Sweden. It is considered in three parts: to the equinox when days continually grow shorter, the period when daylight increases but cold becomes more intense, generally to late February, and the time when light and warmth gradually increase. Winter conditions in various parts of Sweden are chronicled with monthly map Oct.-May, the actual duration of winter in the far North. Diagram shows relationships between the calendar months, temperature, snow cover, ice duration on lakes, and winter period between vegetation seasons for Lapland, Uppland, and Skåne.

43688. ANSTEY, ROBERT L. Handbook of Thule, Greenland, environment. Natick, Mass., Aug. 1956. iv, 42 p. illus., graphs, tables, text maps. (U. S.

Army. Quartermaster Research and Development Center. Environmental Protection Research Division. Tech-

nical report EP-34.) 19 refs.

Environmental conditions (climate, terrain, vegetation, insects) of Greenland, especially in the area of Thule Air Force Base, are described. The climatic material is presented in graphic or tabular form. Climatically the area near Thule has few advantages over either Fort Greely (Big Delta, Alaska) or Fort Churchill for testing cold weather clothing and equipment. It has an arctic coastal environment and provides a testing facility at a higher latitude than regular Dept. of the Army sites.

43689. ANTEVS, ERNST, 1888- . Varve and radiocarbon chronologies appraised by pollen data. (Journal of geology, Sept. 1955. v. 63, no. 5, p.

495-99, graph.) 24 refs.

"Natural correlation with climatic ages of Canadian postglacial forest types . . . confirms the well-suggested view that the ice border oscillations at Cochrane [northeastern Ontario, approx. 49° N. 81°30' W.] antedated the Altithermal which culminated ca. 6,000 years ago. The postglacial crustal rise of the James Bay country required 8,000-10,000 years according to Gutenberg [cf. Arctic Bibliography, No. 6396]. The Cochrane must be the correlative of the European Salpausselkä stage and be some 10,000-11,000 years old. Since the ice retreat from Milwaukee to Cochrane comprised at least 7,000 years, the radiocarbon age of the Two Creeks [Wisconsin] forest bed of 11,400 years must be much too low."—Author's abstract.

43690. ANTHONY, L. MARK, and N. R. MUKHERJEE. Hydrogen ion and soluble heavy-metal distribution of soil horizons over the Cleary Hill gold veins, Alaska. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1805.)

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30, 1956. Soil samples (660) from principal soil horizons at mine near Fairbanks were analyzed for pH and soluble heavy metals. Distribution of hydrogen ions is related to humic acid content of the soil horizon. Minor variations occur in each horizon. In the upper soil horizons

(Aoo, Ao), a higher content of soluble heavy metals than in A, B, and C horizons; and reliable correlation was found between soluble heavy metal content and the gold vein. **Copy seen:** DGS.

43691. ANTIPINA, L. V. Pochvy kolkhoza im. Molotova i printsipy ikh ispol'zovaniâ. (Akademiâ nauk SSSR. Ākutskiī filial, Yakutsk. Institut biologii. Trudy, 1955. vyp. 1, p. 28–44, illus., tables, map.) Ref. Text in Russian Title tr.: Soils of the Molotov Kolkhoz and the fundamentals of their utilization.

A study of the mechanical, agrochemical and gross composition of the main soils in the area of the kolkhoz. Four large soil-groups are represented in this farm: old forest, chernozem-meadow, turf-meadow (alluvial) and peat-bog soils. The first three, being of agricultural value, are discussed in detail, including origin, distribution, plant cover, etc.

43692. ANTONOV, A. S., and others. Tank. Moskva, Voennoe izd-vo Ministerstva oborony, 1954. 607 p. graphs, diagrs. Text in Russian. Other authors: B. A. Artamonov, B. M. Korobkov, and E. I. Magidovich. Title tr.: The tank.

Includes a section on ice crossings (p. 563-66). "The mechanical properties of an ice cover and procedures for the construction of tank crossings are described. Formulas are given for calculating the bearing capacity of an ice cover and the thickness required for crossings by tanks and wheeled vehicles, as well as for determining the speed of ice-cover Wide water bodies can be formation. safely crossed because the floating ice cover acts as a beam on an elastic foundation. Air spaces under the ice cover which appear during winter when the water level drops make an ice crossing unsafe. An ice cover can be reinforced to required thickness by adding extra layers up to 70 percent of the initial thickness at air temperatures of  $-10^{\circ}$  C. or below. The 70 percent limit is determined by the thermal conductivity of the ice, and any additional ice above will cause melting below."-SIPRE.

43694. ANTONOV, L. B. Mestorozhdenie kondrikita Loparsko doliny. (*In:* Khibinskie apatity, 1933. t. 6, p. 111–12.) Text in Russian. *Title tr.:* Formation of kondrikite in the Loparskiy valley.

Formation of kondrikite is outlined in view of the search of new deposits of lovehorrite. Cracks in primary minerals, filled with rare earth compounds and saturated with natrolitic minerals, were transformed into a specific body, called "kondrikite." Often associated with it is a new mineral "carbocer." Genetically the kondrikite, containing 8 percent rare earth, is connected with changes of rinkolite, containing 4-8 percent chloric Geological and geochemical research parties are alerted to investigation of the natrolitic veins, containing other minerals and rare earths, particularly in the regions of Kukisvumchorr and Kuėl'por. Copy seen: DGS.

43701. ANTROPOVA, V. V., and V. G. KUZNETSOVA. Chukchi. (In: Akademiâ nauk SSSR. Institut êtnografii. Narody Sibiri, 1956. p. 896–933, illus., plate.) 30 refs. Text in Russian. Title tr.: Chukchis.

The Chukchis (12,364 in 1926 - 70 percent nomads), the largest ethnic group of the northeastern Paleosiberians, live (preeminently) in the Chukotskiy national district, along the lower Kolyma River and in the Parapol'skiy Dol (Koryak national district). Their distribution within that area, history, relationship and assimilation with the neighboring Eskimos and Koryaks, also the physical conditions, vegetation and wildlife of their area are outlined. The economy and material culture of the two basic groups, the nomadic reindeer herders and the settled sea-mammal hunters, are described: herding and hunting, equipment, tools and weapons, leather and fur production, trade relations with Russians and Americans, food and preservation, clothing, housing: "yaranga" tents predominate with both groups; their means of travel are sketched: reindeer- and dog-drawn sledges, the latter used only by the coastal Chukchis, and Eskimo-type canoes, baldara. The tribal organization (originally matriarchate), slavery, marriage customs (group marriage and "loan" of wives, polygamy), incipient class society, trade and exchange of basic commodities between the reindeer-herders and sea mammal hunters, religious beliefs (animism, spirit worship, shamanism, sacrifices and festivals, burial customs) and folklore are discussed and compared mainly with those of the Eskimos and Koryaks. The post-Revolutionary economic and cultural advances are stressed: collectivization, advantages of mixed reindeer-herding and sea-mammal hunting kolkhozes, introduction of new trades, education, emancipation of women, etc. The description of the pre-Revolutionary period is based on an unpublished(?) article by G. I. Mel'nikov. Copy seen: DLC.

43702. ANTROPOVA, V. V. Itel'meny. (In: Akademi@ nauk SSSR. Institut étnografii. Narody Sibiri, 1956. p. 978– 85, illus.) 13 refs. Text in Russian. Title tr.: Kamchadals.

An historical sketch of the indigenous population of Kamchatka (814 in 1926) stressing the 18th and 19th century oppression of the aboriginals, their revolts against the colonizers and the material benefits resulting from Russian peasant settlers. The native economy and culture are mentioned and the economic reconstruction under the Soviet regime treated as in No. 43701.

Copy seen: DLC.

43703. ANTROPOVA, V. V. Korîâki. (In: Akademiîâ nauk SSSR. Institut êtnografii. Narody Sibiri, 1956. p. 950—75, illus.) 24 refs. Text in Russian. Title tr.: Koryaks.

Outlines the past and present distribution, linguistic and racial affiliation, tribal division, and history of the Korvaks. They numbered 7434 in 1926, approx. 55 percent nomads, and live almost exclusively in the Korvak National District (56°-65° N. 158°-174° E.). The region's climatic conditions, fauna and flora are mentioned. The pre- and post-Revolutionary economy is described: reindeer herding (absence of herding dogs noted), sea mammal and fur-bearing animal hunting, housing and fortification (by earthworks) of settlements, means of travel (draught reindeer used by the nomad, dogs by the settled Koryaks), clothing, food, social conditions, religious beliefs (ancestor worship and transmigration of souls from ancestor to newborn infant, shamanism, etc.) and folklore. The Civil War and foreign intervention are noted and the reconstruction under the Soviet regime discussed: collectivization, economic and cultural advances, etc., as for the Chukchis (No. 43701). The pre-Revolutionary period is described from an (unpublished?) article by the late S. N. Stebnitskii and N. B. Shnakenburg.

destroy the ice.

Delayed melting of winter ice in northern river deltas causes ice barriers and floods in spring. To hasten the break-up and prevent such floods in 1954-55, the winter ice in one arm of the Severnaya Dvina delta was covered by aircraft with black foundry waste and salt. The experiment proved successful and cheaper than using ice-breakers; it is to be repeated on a larger scale in 1956.

n r

Paper delivered on May 8, 1909 to the Arkhangel'sk Society for Study of the Russian North. The common view of a short navigation season in the White Sea (4-5 months, May-Oct.), is refuted on the basis of meteorological and hydrological data and the writer's observations. Navigation is claimed possible for 8-9 months (May-Jan.). The high temperature and salinity of the water, fast tide currents, especially in the "Gorlo" (narrows), and prevailing winds keep the sea open until January; the heavy ice occurs in the spring.

43707. ANWAR, YEHIA M. Geological investigations in East Greenland, part 5. The petrography of the Prinsen af Wales Bjerge lavas. København, C. A. Reitzel, 1955. 31 p. illus., text map, 10 tables. (Meddelelser om Grønland. Bd. 135, nr. 1.) 19 refs.

A petrographical investigation made on lavas collected by L. R. Wager in the region 69° N. 32°-33° W. during the British East Greenland Expedition. 1935-1936. Field observations on the lavas were published earlier (cf. Arctic Bibliography, No. 19030). The Prinsen af Wales lavas form the top of the Plateau Basalt Series of lavas and tuffs of the Knud Rasmussens Land Kangerdlugssuaq region; they are the latest lavas known from this part of East Greenland. Their classification and distribution are given, and the various types discussed in some detail, with chemical analyses; the underlying plateau basalts are also noted. Main features of the lavas are summarized and their similiarity to certain Hawaiian lavas indicated. Origin has not been determined. Copy seen: DGS.

43711. APPLEMAN, H. Low-temperature fog at the Edmonton airport as influenced by moisture from the combustion of natural gases. (Royal Meteorological Society, London. Quarterly journal, Jan. 1956. v. 82, no. 351, p. 99.) 3 refs.

Contains critique of G. W. Robertson's study (pub. in Royal Meteorological Society Quarterly journal 1955. v. 81, p. 190) on the combustion of hydrocarbon fuels and fog formation in which the heat of combustion was neglected. Added heat tends to lower the relative humidity of the environment. At lower temperatures such combustion actually produces fog. The combustion of natural gas would never result in saturation at temperatures much above -20° F. A reply by Robertson follows on the same page.

Copy seen: DLC.

43712. APPLEMAN, H. A note on the effect of aircraft exhaust on airport visibility. (American Meteorological Society. Bulletin, Jan. 1956. v. 37, no. 1, p. 19-21, graph, table.) 8 refs.

Case of reduced ceiling and visibility at Goose Bay, Labrador (53°20′ N. 60°25′ W.), on Dec. 4, 1954 is analyzed; it was apparently caused by the landing of three flights of F-86 jet aircraft; air temperatures were 9-12° F. Incomplete combustion of F-86 engines at low altitudes produces great quantities of

smoke and other nuclei which can "seed" an area on conditions of stability in the lower atmosphere, calm or very light winds, and high relative humidities. "Except for absence of a saturation requirement, these conditions are rather similar to those giving rise to radiation fogs." J. Clodman (q. v.) also dealt with this incident. Copy seen: DGS.

**43713.** APPLIED HYDRAULICS. Cold weather operation of hydraulics. (Applied hydraulics, Feb. 1956. v. 9, no. 2, p. 67–68, 111, illus., graph.)

Results are given of a laboratory study to determine the effect of oil viscosity on the operating efficiency of vane-type pumps. Hydraulic oils having high viscosity indices give maximum assurance of good starting characteristics at low temperatures while assuring good operation at higher temperatures. particularly important design factors at low temperatures determining maximum permissible oil viscosities for efficient operation are length and configuration of the pump intake pipe and the static head of oil in the feed reservoir relative to the Copy seen: DLC. pump.

Describes prefabricated cold-weather housing. Sandwich panels  $(Y_i)''$  plywood sheets on both sides of  $3Y_i''$  glass fiber insulation) are  $4 \times 8$  ft. and lend themselves to modular construction. The floor truss ends will rest on  $6 \times 8$  in. wooden beams laid across wooden pads, which are  $4 \times 8$ -in. planking. These pads are placed 2.5 ft. outside the structure to prevent snow from melting under the pads. One  $20 \times 48$  ft. unit can be erected in 60 man-hours at  $-90^{\circ}$  F. Each unit will have its own heating and ventilating system, and a snow-melting tank with heat-exchanger coils. Copy seen: DLC.

43719. ARCTIC. Geographical names in the Canadian North. (Arctic, 1956.

v. 9, no. 4, p. 272-75.)

Lists 130 names and changes adopted by the Canadian Board on Geographical Names, Sept. 1955–May 1956, for official use in the Northwest Territories and Yukon. The names are presented according to the map sheets on which they appear, with approx. latitude and longitude of the geographic feature.

43720. ARCTIC CIRCULAR. Agreement between Canada and the United States on the establishment of a Distant Early Warning system in Canadian territory. (Arctic circular, 1956. v. 9, no. 2, p. 23-31.)

Contains terms agreed upon May 5, 1955, relating to construction by the U. S. Government of DEW Line radar stations in the Canadian Arctic, viz.: location and size of airstrips and other sites, liaison arrangements, construction plans, provision of electronic equipment, construction and procurement, Canadian law; operation, ownership of removable property, telecommunications, scientific information, matters affecting Canadian Eskimos, Canadian immigration and customs regulations, use of airstrips, landing facilities, transportation, resupply arrangements, taxes, status of forces, supplementary arrangements and administrative agreements.

Copy seen: DLC.

43721. ARCTIC CIRCULAR. An airborne magnetometer survey of the arctic islands, 1955. (Arctic circular, 1956. v. 9, no. 1, p. 4-7, text map.)

In June 1955, an airborne magnetometer and scintillata-counter survey was made in the Queen Elizabeth Islands in conjunction with the helicopter-supported geological mapping project (Operation Franklin) of the Geological Survey of Canada. The Survey's Canso aircraft was based at Resolute, Cornwallis Island. The flight from Ottawa to Resolute is described. A modified program (due to poor weather) was completed by July 1. Flight lines are shown on map.

Copy seen: DLC.

43722. ARCTIC CIRCULAR. American Society of Polar Philatelists. (Arctic circular, 1956. v 9, no. 1, p. 10.)

This new society is affiliated with the American Polar Society. Its newsletter, Ice cap news, issued six times a year, deals with all aspects of polar postal news. Membership information is given.

Copy seen: DLC.

43723. ARCTIC CIRCULAR. Anthropological studies among the Attawapiskat Indians. (Arctic circular, 1956. v. 9, no. 1, p. 9-10.)

Personality characteristics of the Cree population of this region west of James Bay (52°57′ N. 82°15′ W.) were studied in summer 1955 by a party of four. Dr. J. J. Honigmann, the leader, noted that Indians were more familiar with the outside world than on his previous visit in 1947-48, that many had gone south to work, and the remainder seemed better off economically. Housing program was begun in 1955.

**43724.** ARCTIC CIRCULAR. C. G. S. "Baffin" officially accepted by the Canadian Hydrographic Service. (Arctic circular, 1956. v. 9, no. 3, p. 45–46.)

Notes delivery (Jan. 22, 1957) to government service of new ice-breaker research vessel (cf. No. 38552). The Baffin can be self-supporting for an entire season. During winter 1956–1957 she was used as an ice-breaker in the St. Lawrence; in summer 1957 she will carry out charting work off southwest Baffin.

Copy seen: DLC.

43725. ARCTIC CIRCULAR. Coats

of arms for the Yukon Territory and the Northwest Territories. (Arctic circular, 1956. v. 9, no. 3, p. 43-45, 2 illus.)

Armorial bearings incorporating such novel heraldic motifs as Eskimo dog, snow, arctic fox, narwhal, were designed by Lt.-Comdr. Alan B. Beddoe and registered by College of Heralds.

Copy seen: DLC.

43726. ARCTIC CIRCULAR. The mace of the Council of the Northwest Territories. (Arctic circular, 1956. v. 9,

no. 1, p. 9.)

The mace, presented to the Council in Jan. 1956, is made of northern materials, carved by Eskimos of Cape Dorset, Baffin Island, with quillwork by Indians of Yellowknife. It has been on display in Ottawa and various other Canadian cities, 1956–1957. Copy seen: DLC.

**43727.** ARCTIC CIRCULAR. Northern activities of the Geodetic Survey, 1955 and 1956. (Arctic circular, 1956.

v. 9, no. 2, p. 21-23.)

Notes (no results given) astronomic determinations made during the Labrador trip to Foxe Basin, summer 1955; extension of shoran network in 1955-1956 to cover the Yukon and southern arctic islands (to about 75° N.); extension of triangulation network along Hamilton River, Labrador, to Atlantic coast, and reconnaissance between Knob Lake and Nain; precise level line completed in 1956 along the Quebec North Shore and Labrador Railway from Seven Islands to Schefferville (Knob Lake). Geodetic Survey staff members taking part are listed. Copy seen: DLC.

43728. AREZIO, GIORGIO, and others. Azione del citocromo C sul cuore isolato in ipotermia. (Minerva cardioangiologica, 1956. anno 4, no. 9, p. 574-77, illus.) 20 refs. Text in Italian. Summary in English. Other authors: P. Metalli and G. Silini. Title tr.: Action of cytochrome C on the isolated heart during hypothermia.

Account of observations on isolated guinea pig hearts perfused with Ringer of different temperatures containing various amounts of cytochrome C in solution. This cytochrome showed a certain effect only on cardiograms abnormal either due to low temperature or due to experimental

condition (heart isolated).

Copy seen: DNLM.

43729. AREZIO, GIORGIO, and others. Azione del freddo sul cuore isolato; studio elettrocardiografico. (Minerva cardioangiologica 1956. anno 6, n. 3, p. 189-97, illus., tables.) 23 refs. Text in Italian. Summary in English. Other authors: P. Metalli, and G. Silini. Title tr.: The effect of cold on the isolated heart; electrocardiographic study.

A study of the isolated, Ringerperfused heart of the guinea pig. Electrocardiographical changes produced by cold consisted in a slowing of the rate and morphological changes of the tracings. All modifications were reversible by

raising the temperature.

Copy seen: DNLM.

43730. AREZIO, GIORGIO, and others. Azione dell' A. T. P. sul cuore isolato in ipotermia. (Minerva cardioangiologica, 1956. anno 4, n. 6, p. 364-69, illus.) 23 refs. Text in Italian. Summany in English. Other authors: P. Metalli and G. Silini. Title tr.: The action of ATP upon the isolated hypothermic heart.

Account of electrocardiographic observations on isolated guinea pig hearts maintained in Ringer solutions of 20° and 38° C. The effect of addition of various concentrations of ATP to the solutions are traced and the underlying

mechanism and nature of the effects discussed. Copy seen: DNLM.

AREZIO, GIORGIO, and T. 43731. BERETTA. Influenza di farmaci neurovegetativolitici sulla reazione organica alle variazioni ambientali di temperatura. (Acta anaesthesiologica, 1955. v. 6, no. 4, p. 299-311, illus.) 7 refs. Text in Italian. Summary in English. tr.: Effect of neurovegetativolytic drugs on the organic reaction to ambient temperature changes.

Account of animals made hyper- and hypothermic by Di Macco's method and simultaneously treated with Largactil or Hexamethonium. Largactil was found to inhibit both sections of the neurovegetative system, while the second drug affected only the orthosympathicus. Largactil had also a much stronger metabolism-lowering effect than Hexamethonium. Copy seen: DNLM.

43732. AREZIO, GIORGIO, and others. sull'ipotermia ipoossica Studio coniglio. (Minerva chirurgica, Sept. 1956. anno 11, no. 18, p. 874-79, illus.) 6 refs. Text in Italian. Other authors: P. Prioreschi, G. Silini, and P. Metalli. Title tr.: Study of hypoxic hypothermia in the rabbit.

Account of investigation on rabbits made hypothermic with and without reduction of ambient oxygen. effects of falling ambient temperature, of restraint and of both combined upon the two groups of hypothermic animals was studied, including body temperature, ECG, survival, etc.

Copy seen: DNLM.

AREZIO, GIORGIO, and C. 43733. ARISI. Studio sull'ipotermia ipoossica nella cavia. (Acta anaesthesiologica 1955. v. 6, no. 4, p. 273-82, illus., table.) 5 refs. Text in Italian. Summary in Eng-Title tr.: A study in hypoxic hypothermia in the guinea pig.

Account of investigation of the behavior of guinea pigs submitted to hypothermia and hypoxia with muscular movements restrained. Restraint was found to be important in reaching hypothermia but the latter is obtained easier and with less risk with Ozlevels in respiratory air progressively reduced.

Copy seen: DNLM.

ARISI, C., see Arezio, G., and C. Arisi. Studio sull'ipotermia iposssica nella cavia. 1955. No. 43733.

43734. ARKELL, WILLIAM JOSCE-LYN. 1904- . Jurassic geology of the world. New York, Hafner, 1956. xv, 806 p. 46 plates, text maps, cross-sections,

28 tables. approx. 2800 refs.

A basic work, representing "the first attempt at a synthesis of one system on the basis of marine faunas in all parts of the world." Main part of the book is arranged geographically by continents or major parts of continents, subdivided by regional units. In Pt. 6 (Northeastern Europe and northern Asia) and Pt. 7 (America and Antarctica), the following arctic regions are dealt with in turn (p. 498-538): Pechora River basin, Zemlya Frantsa-Iosifa; Svalbard; Andøy and Lofoten Islands (Norway); Ob' Anabar River basins; northeastern Siberia and Novosibirskiye Ostrova; Lena and Vilyuy River basins; East Greenland coast between 70°-77° N.; Prince Patrick Island in the Canadian Arctic Archipelago; arctic slope of Yukon and Alaska; Alaska; southwest Yukonsouthern British Columbia Coast Ranges. concluding portion of the book the stratigraphic data are surveyed for the information given on the oceans (including Arctic Basin), faunal realms, climate, paleogeography, volcanic and plutonic activity, and earth movements. The extensive bibliography is arranged by regions to correspond with the text. Reviewed by Carey Croneis in American Association of Petroleum Geologists, Bulletin, Nov. 1956. v. 40, no. 11, p. 2759-61; and by Ralph W. Imlay in Journal of Paleontology, Nov. 1956. v. 30, no. 6, p. 1376-77.

Copy seen: DGS.

43735. ARKTISK INSTITUT, Køben-Danish scientific activities in Greenland in 1955. Charlottenlund. 1956? 10 p. Mimeographed.

Contains descriptions of Geological Survey of Greenland investigations in the Southwest, and glaciological studies between Godthaab and Narssaq; ground temperature measurements at Mesters Vig, and paleontological investigations in East Greenland. The 35-man Geological East Greenland Expedition led by Lauge Koch which worked in the Daneborg-Danmarkshavn region, Traill Ø, and west of Staunings Alper is reported; also the eight-man Danish National Museum-Geological Survey of Greenland archeological expedition to Disko Bay, led by E. Holtved. E. Knuth's archeological investigations in Danmarks Fjord, and Chr. Vibe's zoological investigations in Egedesminde Distrikt and Søndre Strømfjord are noted. Activities of Greenland Fisheries Investigations along the west coast and in Davis Strait are indicated. F. Terkelsen collected fungi in West Greenland.

**43736.** ARMOUR RESEARCH FOUN-DATION, Chicago, Ill. Investigation of solar energy for ice melting, final report. Chicago, June 1, 1949. 54 l. diagrs., tables. (U. S. Coast Guard. Project no.

90-688D.) 22 refs.

"The possibility of melting ice on rivers and lakes by applying a layer of material that would absorb the solar energy was studied. An analysis, which assumed steady state conditions, showed that the addition of an absorbent laver causes melting if the air temperature is about 32° F. and the intensity of solar energy is between 800 and 1,000 B. t. u./ sq. ft./day. When melting occurs under natural conditions, an absorbent layer would increase the rate 2 or 3 times (approx. 1 to 2 in./day according to the clearness of the ice sheet). Study of industrial waste materials as possible absorbers is recommended. It is estimated that 105,000 lbs. of industrial slag of dark color (absorbtivity 0.70 to 0.80) would give a layer 0.03 in. thick, 100 ft. wide, and a mile long."-SIPRE. Copy seen: DLC.

43737. ARMSTRONG, J. G. Ten-man arctic ration pack X-50; report of trial on DIDTEST II, February 1950. Ottawa, Toronto, 1954. 3, 35 p. illus., tables, map. (Canada. Defence Research Medical Laboratories. Report

no. 173-1.) 3 refs.

Account of tests of this experimental pack, by 25 participants of the Exercise at Fort Churchill, Manitoba, Feb. 6-18, 1950. It is indicated that a five-man pack would be more suitable for the troops under existing conditions. Some reduction in the quantity of food is advised, and improvements or replacements are suggested for a series of items. More variety and better choice is suggested for the noon meal, etc.

Copy seen: DNLM.

43738. ARMSTRONG, J. G. U. K. 10-man composite ration pack; report of Canadian Army user trials during winter training exercises January-March 1950.

Ottawa, Toronto, August 1954. 3, 18 p. illus. tables. (Canada. Defence Research Medical Laboratories. Report no. 173–2.)

Based on experience reports of 450 Canadian Army personnel who used the ration. A five-man pack and over 4,000 calories per man per day are recommended together with higher acceptability for Canadians, better cans and packages, etc. Cigarettes, chewing gum and paper towels should be included.

Copy seen: DNLM.

43739. ARMSTRONG, J. G. U. S. aretic trail ration AT-1; a report of Canadian Army user trial during Exercise Sun Dog 1, February—March 1950. Ottawa, Toronto, August 1954. 3, 19 p. illus., tables. (Canada. Defence Research Medical Laboratories. Report no. 173-6.) 2 refs.

Account of tests aimed to determine the suitability of this ration "in providing food and necessary accessories for infantry troops engaged in patrol exercises during cold weather." The quantity of food was considered insufficient, partially due to low acceptability of the meat bar; other considerations regarding preference, quality, type, packing, etc., are stated.

Copy seen: DNLM.

43740. ARMSTRONG, J. G. U. S. individual combat ration C-3; a report of a Canadian Army user trial during winter training exercises 1949–1950. Ottawa, Toronto, August 1954. 3, 16 p. illus., tables. (Canada. Defence Research Medical Laboratories. Report no. 173-4.)

Report based on comments of 22 Canadian Army personnel who used this ration during training exercises in Feb. 1950. The pack was found satisfactory

for cold-weather operations.

Copy seen: DNLM.

43741. ARMSTRONG, J. G. U. S. small detachment ration 5-in-1B; a report of Canadian Army user trials during winter training exercise January—March 1950. Ottawa, Toronto [1954?] 3, 16 p. illus., tables. (Canada. Defence Research Medical Laboratories. Report no. 173–3.) 2 refs.

Reports of three groups comprising 185 army personnel who used this ration. Five-man packs were found preferable to any others; favored items and suggestions as to quantity, types of food, size of cans, etc., are listed.

43742. ARMSTRONG. TERENCE EDWARD, 1920-, and B. B. ROB-ERTS. Illustrated ice glossary. (Polar record, Jan. 1956. v. 8, no. 52, p. 4-12, 40 illus.) ref.

Contains approx. 70 sea ice and associated terms, an abstract of a fuller glossary, covering also land ice terms, projected for future publication by the Scott Polar Research Institute. It is a development of a British Admiralty glossary pub. in 1953 (Arctic Bibliography, No. 34989). This shorter version is intended as a practical aid to navigation, covering the minimum number of terms required. Each term is briefly defined and reference is made to photograph in which the feature is illustrated. Following the alphabetical listing is a classified summary in which terms are listed under three main headings (floating ice, land ice-glaciers, navigation in ice).

ARMSTRONG. 43743. TERENCE EDWARD, 1920- . Otto Yul'yevich (Geographical journal, Dec. Shmidt. 1956. v. 122, pt. 4, p. 534.)

Obituary of this noted Russian oceanographer, 1891-1956, Director of the Arctic Institute U. S. S. R., 1930-1932, and Head of the Chief Administration of the Northern Sea Route, 1932-1939. His leadership of the Sibiriakov (1932) and Cheliuskin (1933-1934) expeditions, and organization of the first so-called North Pole drifting station in 1937 are noted, also his dismissal in 1939, and subsequent editorial, etc. work. Copy seen: DGS.

43744. ARMSTRONG. TERENCE EDWARD, 1920- . Sea ice recording and reporting methods. Ottawa, Defence Research Board, Apr. 1955; published: Queen's Printer, 1957. 53 p. diagrs., fold. map, fold. table. 43 refs.

"The problems involved in, and types of information needed for, recording and reporting floating ice are outlined; existing methods are reviewed; and a new system for use in the Canadian Arctic is recom-The problems considered include: terminology, recording of information and symbols used, and the transmission of data from airborne, shipborne, and shore observers by radio (in code form or by facsimile charts) and in the form of a log book or ship's-track charts. The use of ice records for short-range forecasts of ice movements and in studies on the general patterns of ice behavior is also considered. A list of Russian, Finnish, Norwegian, Swedish, Danish, German, French, and Spanish equivalents of recommended English terms and the various codes in current use are appended. and a comparison is made between the U. S. Hydrographic Office system and that recommended for Canada."-SIPRE. Copy seen: DN-HO.

Copy seen: DLC.

43745. ARMY AVIATION. It happened in Alaska. (Army aviation, Aug. 1955. v. 3, no. 8, p. 19-21, illus., map.) Contains account of operations of the U. S. Army 30th Engineer Group in Alaska. The group unloaded in Anchorage for transfer to Kotzebue and Umiat. The operations were supported by U.S. Army helicopters and light planes.

ARNAL, MARIE-CLAUDE, see Chevillard, L., and others. Variations de la sensibilité douloureuse . . . 1956. 44335.

Otter aircraft were particularly valuable

in air operations.

43746. ARNELL, HAMPUS WILHELM, 1848-1932, and C. E. O. JENSEN. Die Moose des Sarekgebietes, Abteilung I-III. (In: Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907-1939. 3, Botanik, Lfg. 2, pub. 1907, reprinted 1920, p. 71-132, diagrs.; (II-III), Lfg. 3, pub. 1910, p. 133-268, diagrs., tables.) 36 refs. Text in German. Title tr.: The mosses of the Sarek region, I-III.

Following a description of the area, its vegetation zones, the itinerary, weather, etc., a study of the liverworts and peat mosses is presented first (p. 74-132) with details on location and substrate, taxonomy, geographic distribution, anatomy, biology, etc. Some 118 forms are dealt Part 2 (p. 133-221) covers the with. mosses proper along similar lines; 260 forms are described. Part 3 (p. 221-47) contains a general discussion of the mosses of the area; their distribution according to plant zones; distribution according to taxonomic grouping: frequency of occurrence; fertility; geographic origin. In a final section (p. 248-66), the junior author discusses the plant associations in which mosses occur and the moss associations. The study is the first one on mosses and related plants of the area; the field work was carried out (approx. 67°20′ N. 17°30′ E. 590–920 m. alt.) in summer 1902. *Copy seen:* CaMAI.

43747. ARNELL, KNUT. Vegetationens utvecklingsgång i Norrland. Uppsala, Almqvist & Wiksell, 1927. 28 p. tables. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, bd. 4, no. 1.) Text in Swedish. Summary in German. Title tr.: Course of development of vegetation in Norrland.

A plant-phenological study based on observations during 1873–1924 in northern Sweden (Norrland) which includes central and southern Lapland. The aim of the study is to determine the median date of phenological events (blooming, fruiting, leaf-fall) and their progression in a northward or opposite direction. Common trees and wild plants and flowers, vegetables, fruit and berries, cereals, hay, etc., are included.

e

The formation of ice covers over stationary and moving waters is described using specific ice terminology approved by the Second Hydrological Conference. Terms described and illustrated include slush, ice foot, "nilas" (frozen snow slush), pancake ice, snow ice, puddle ice, "torosy" (hummocks) "stamukha" (stranded ice cake), "polynya", polar pack, hummock, icebergs, etc. The structure of clear, semi-transparent, and sludge ice is analyzed.

Following a theoretical analysis of the physiology of heat transit through the periphery ("shell") of the human body, the author discusses this problem on the basis of extensive experiments. These include such on heat transfer from the extremities to ambient media; heat transit through the extremities under various temperatures of ambient air or water; blood circulation under above conditions; experiments with dummies; diurnal fluctuation in temperature of

various body regions; and diverse environmental conditions, etc.

Origin of the Kiruna type ores is discussed from a geochemical viewpoint, the question being whether they could originate through the process of liquid immiscibility or fractional crystallization, or whether secondary enrichment is necessary.

\*Copy seen: DGS.

43764. ASKLUND, BROR HENRIK VALDEMAR, 1896— . Apatitjärnmalmernas differentiation. (Geologiska föreningen, Stockholm. Förhanglingar, 1949. bd. 71, håfte 1, no. 456, p. 127–76, 185–91, 4 illus., 24 diagrs. text map) 54 refs. Text in Swedish. Summary in English. Title tr.: The differentiation problem of apatite iron ores.

The problem, as presented here, is whether differences in Swedish iron ores of the Kiruna type are the result of differences in magmatic occurrence in Archean time or of more recent processes. The Kiruna ores, low in silica and variable (but frequently high) in soda content, are likened in origin to those of the Adirondack Mineville district and others, in the possibility that they are concentrations arising out of the surrounding volcanies, which seem to be related to local original differences of subcrustal nature. Ternary diagrams are used to illustrate differences in the ores. Conclusion is offered that differentiation originates in the nature of the parent magma, detectable especially in its low silica content, and that the ore relationships can be traced by means of the contained phosphorus. Discussion Per Geijer, N. H. Magnusson, Looström, T. Hagerman and the lecturer is added (p. 185-91).

Text Title tr.: Norges geologi in Swedish. and the problem of the border mountain

Comparison of the Norwegians' and Swedes' viewpoints on the geology on their respective sides of the Caledonide mountains that form all except a small part of their common boundary. Beginning with Holtedahl's view of the pre-Devonian geosyncline (cf. his Norges geologi, No. 29684), investigations in the two countries are compared. In well separated sections of the peninsula, reconstruction of the history which coordinates an outcrop in Norway with one in Sweden may be difficult and questionable. But where an anticline crosses the border, as one does well north of Trondheim, its history in the two countries must be reconciled. These considerations involve the geology of arctic Scandinavia. 43776. AUSTIN, JAMES MURDOCH, 1915—, and S. L. HENSEL. Analysis of freezing precipitation along the eastern North American coastline. Lexington, Mass., Massachusetts Institute of Technology, Lincoln Laboratory, Mar. 23, 1956. iii, 46 p. illus., diagrs., text maps, tables. (Its: Technical report no. 112) 7 refs.

Freezing precipitation was studied from Thule, Greenland to Nantucket, Mass. to provide a basis for the design of thermal anti-icing equipment for large rigid radomes. Monthly summaries of meteorological reports were utilized for six representative stations selected for detailed study (Gander, Cape Harrison, Frobisher, Yarmouth, Thule and Nantucket.) Data. representing three to four years' observations from each station were analyzed: (1) range of precipitation rates for freezing rain and snow, and the freezing and duration of such rates; and (2) wind speed and temperature regimes accompanying such rates. The geographical extent of such storms was also studied. The Newfoundland peninsula has the greatest frequency and highest rates of rain and drizzle. They practically never occur at Thule. cipitation rates decrease toward the Pole. Appended are calculation of icing rates; analysis of climatic data at Thule, Frobisher, Cape Harrison, Yarmouth, and Nantucket; effect of snow density on accumulation rate; and an abstract of a report entitled "Wet snow precipitation along the northeastern American coastline." Investigation of the water, ash, and alginic acid content of the brown alga, Laminaria digitata, collected in Lofoten, Norway. shows variation from one plant to another in the same collection. Such factors as depth, latitude, or time of year are influential, as may be age, and stage of development. External and experimental errors are considered, and suggestions made for effective study.

43794. BÅTH, MARKUS, 1916— . An earthquake catalogue for Fennoscandia for the years 1891–1950. Stockholm, 1956. 52 p. table, map. (Sweden. Geologiska undersökning, Ser. C, no. 545, årsbok 50 (1956), no. 1.) About 80 refs.

Lists all known earthquakes and cites sources of the macroseismic data. The data include origin time and location of the epicenter with estimate of their accuracy, maximum intensity, limit of perceptibility in km. and magnitude. Stronger and weaker shocks are tabulated separately for each year, the former regarded as a basis for research and the latter a complement. A geographical and magnitude index is appended.

Copy seen: DGS.

43794A. BÅTH, MARKUS, 1916—. The problem of microseismic barriers with special reference to Scandinavia. (Geologiska föreningen, Stockholm. Förhandlingar, 1952. bd. 74, häfte 4, no. 471, p. 427–49, 4 diagrs., 4 tables.) 20 refs.

Irregular distribution of energy in microseisms has led to postulation that variations are caused by barriers, possibly faults, in their pathway. Investigation was made of the effects of the fault at the edge of the northwest European continental shelf. Extending from west of Spitsbergen toward the British Isles, the fault approaches the west Norwegian coast near the Lofoten islands and again in the south, but between these two locations lies farther off-coast. Records from Bergen, where the seismograph station is on hard gneiss, from Upsala, where it is on granite, both on the Scandinavian shield, and from Copenhagen, where the station is on chalk outside the shield, indicate that microseismic waves induced by passage of cold fronts over the fault are less energetic than those induced by passage over the coast. It is possible that this fault, which may be a single breech in structure, is insufficient to produce barrier effects. Other considerations are introduced.

43795. BÅTH, MARKUS, 1916—. Travel times of the principal earthquake waves for Uppsala. Uppsala, Almqvist & Wiksell, 1947. p. 105–129, fold. map, tables. (Upsala. Universitet. Meteorologiska institutionen. Meddelande, nr.

11.) 14 refs.

Records of 315 earthquakes occurring in the period 1913–1943, in which the epicenter was probably located within 2° of arc, were studied to determine travel times to Upsala (59°51′29" N. 17°37′37" E.). Resulting travel times for various wave phases are tabulated. Possible errors in the observations are discussed.

Contains a Latin diagnosis and English description of a single specimen collected in 1950 by R. M. Chapman along the Kukpowruk River in northwest Alaska (68°30′-69°30′ N.). A synoptical comparison is presented of 11 morphological features and one anatomical character of Y. americana and those of Soroseris and Youngia, genera hitherto restricted to Asia in natural distribution. The plant is also reminiscent of Crepis nana typica in its tufted habit and dark green, glabrous foliage.

Opredelenie modulia deformatsii gruntov, 1955. p. 5–16, diagrs., graphs.) Text in Russian. Title tr.: Methods of determination of rated values of moduli of soil deformation.

"Modulus of deformation" (proportionality) is represented by the ratio of specific load (P) and load area (A) to depth of deformation (C). The rated values of deformation are determined experimentally for different types of soils under different conditions. The effects of natural conditions are discussed, includ-

ing the effects of wet and frozen soils and their seasonal changes. Laboratory and field load-deformation tests and recalculation of the modulus in theoretical formulas using measured deformation are included. Strain is recomputed for good and damaged old road surfaces and proper adjustments are made to the basic tables. Systematic observations of the road conditions must be made by special stations located in different zones.

Account of investigations on a dog preparation where the work of the heart is kept constant. Hypothermia produced a fall in 0<sub>4</sub>-uptake which, between 36° and 26° C. showed a logarythmic relationship, with a Q<sub>10</sub> of 1.83. The decrease in oxygen consumption is attributed to at least two factors: effect of cold on metabolic rate of the myocardium and to bradycardia. *Copy seen:* DNLM.

43811. BADIGIN, KONSTANTIN SER-GEEVICH. Po studenym morfam [Ocherki po istorii ledovykh plavanii russkikh pomorov]. Moskva, Gos. izd-vo geogr. lit-ry, 1956. 423 p. illus., tables, maps. Over 250 refs. Text in Russian. Title tr.: On the arctic seas [Sketches of the history of the polar voyages of the Russian Pomors].

Russian expansion toward the North began in the 10-11th centuries, from Novgorod. Adventurers, attracted by the abundance of fur animals and fish, followed the waterways to the White Sea, and settlers on this seacoast became known as "Pomors." The Pomors adapted their vessels to arctic seas, entered the Barents Sea, and discovered Spitsbergen and Novaya Zemlya. They sailed along the north coast and, long before Dezhnev and Popov, reached the northeast limits of Asia and penetrated to northwestern America. Russian arctic navigation flourished during the 13-15th centuries, came to a standstill in the 17th, and later declined. Readers are cautioned (p. 5-6) that this outline of the early Russian voyages lacks documentation, is based on the author's conjectures, hypotheses, etc., and on philological data. Though accessible to criticism, the views advanced by this notable arctic explorer, may induce further, conclusive investigations. Of special interest is his account of sealing and ice conditions in the White Sea (p. 27-42); the maritime route to Mangazeya (p. 123-45); early Russian shipbuilding and Pomor vessel types: lod'ia, koch, shniaka, karbas (p. 171-207). The 15th century voyages of a Russian sailor, Ivan Novgorodets (Ivan Olegovich Amosov), from the White to Baltic Sea and to the River Ob', are recounted from copies of a lost manuscript of doubtful authenticity (p. 100-122). Appended is an extensive bibliography; a glossary of Russian arctic navigational terms, with 22 refs. (p. 318-416); and (p. 417-23) the text of an early regulation on internal arrangements of Pomor hunting parties Copy seen: DLC. or arteli.

43812. BAEDEKER, KARL, firm, publishers, Leipzig. Norwegen, Dänemark, Island, Spitzbergen; Handbuch für Reisende. 14. Aufl. Leipzig, K. Baedeker, 1931. 512 p. maps inel. fold. maps. Text in German. Titte tr.: Norway, Denmark, Iceland, Spitsbergen; handbook for travelers. 14th ed.

Coverage of Norway includes description of journey from Trondheim to Namsos and Mosjøen by land; by sea from Trondheim to Bodø, Lofoten, Vesterålen, Tromsø, Nordkap, and Kirkenes; by land from Bodø to Narvik and beyond. Information is given on accommodations, regulations, recreation, clothing needs, language, geographic names, and history. Section on Svalbard (p. 466–74 and map) describes features visited by tourist vessels.

Vergleichung eines von Herrn Obrist Hofman mitgebrachten Karagassen-Schädels mit dem von Herrn Dr. Ruprecht mitgebrachten Samojeden-Schädel; lu le 31 mai 1844. (Akademiña nauk SSSR. Bulletin, Classe physicomathématique, 1845. t. 3, no. 12, p. 177–87) ref. in text. Text in German. Title tr.: Comparison between a Karagass skull brought back by Colonel Hofman and a Samoyed skull brought back by Dr. Ruprecht; paper read May 31, 1844.

Discusses and compares the cranial and facial structures of Samoyeds, Finns, Lapps, Aleuts, Greenland and Bering Strait Eskimos, Buryats and Karagass. The differences between Lapp and Samoyed and analogies between Samoyed and Eskimo skulls are stressed. The divergencies between the Karagass and Buriat skulls are noted and the former, though shorter and flatter, likened to those of the Samoyeds. An Eskimo-Samoyed branch of the Mongolian race is suggested.

43821. BAKAKIN, V. P. Led v kachestve materiala dlía zakladki vyrabotannogo prostranstva. Moskva, Izd-vo Akademii nauk SSSR, 1955. 83 p., illus., graphs, diagrs. (Akademiía nauk SSSR. Institut merzlotovedeniía.) 14 refs. Text in Russian. Title tr.: The use of ice filler in abandoned mine shafts.

The use of ice and iced waste rock materials is considered for filling empty shafts, slopes and tunnels in coal or ore mines to prevent fall of overhead rock and explosion of accumulated combustion The physical and mechanical gases. properties of ice are described and compared with those of other construction materials. Data on the properties of fossil, river, and naled ice are tabulated. Investigations at the Institute of Permafrostology showed that the adfreezing strength of ice on wood and concrete exceeds at low temperatures that between rock and soil particles. Successful experiments in the use of ice for filling abandoned spaces at several places in the U. S. S. R. are described in detail. The shaft, etc., was packed with ice blocks, or flooded and the water frozen by cold air circulation, or both methods were used alternately. Various systems of water and air supply and tunnel arrangements are described and heat exchange computed for specific conditions of northern regions. Copy seen: DLC.

Environmental Protection Research Division. Technical report EP-14.) 17 refs. Other authors: R. F. Byrom, F. Daniels, and E. H. Munro.

Account of observations on men exposed for two hours to 15° C. Fat, as measured by skinfold thickness, showed a strong relationship to both skin and rectal temperatures, the fat subjects maintaining near normal temperatures in the cool environment. But fat men showed generally lower skin temperatures. All these conditions indicate that skin fat acts as an effective insulator.

Vol. 2, on the economic, social and political history of the Russian centralized state of the 15th-17th centuries, includes two papers touching on the North; viz. (titles translated): Agents of 17th century Russian merchants; and Commercial enterprises of Russian merchants

in the 17th century.

Vol. 3, on the history of Siberia in the 16th-17th centuries, is in two parts: the first, on problems of colonization consists of: Sketches on the history of colonization of Siberia in the 16th-17th centuries; P. Khmelevskil; A. F. Pali Gayn; Hire practice in the sable trade of the 17th century; Free peasant communities of Siberia; The trading houses of the merchant Nikitin in Siberia and China; The governors of the Tobol'sk district in the 17th century; Mangazeya "mir" community in the 17th century (No. 27939); The legend of Vasilil of Mangazeva.

Vol. 3, pt. 2, on the history of the Siberian peoples, contains: Samoyeds in the 17th century; The historical fate of Yakutia (No. 990.); Fur tribute in Siberia in the 17th century; Ostyak and Vogul principalities in the 16th-17th centuries (No. 20425); The historical study of the peoples of the North; Beneficial results of Russian colonization and the annexation of Yakutia; The problems of the historical study of Siberia (No. 33433); Current problems of the historical study of Yakutia.

Each paper is described; those in previous volumes of this Bibliography

previous volumes of this Bibliography indicated by number.

Paper delivered in July 1947 at the First scientific session of the Yakut scientific-research base of the Academy of Sciences U. S. S. R., devoted to the 25-year anniversary of Yakut A. S. S. R. and published in its "Doklady", Yakutsk, 1948, p. 28–42. Text in Russian. Title

tr.: Current problems of the historical study of Yakutia.

Describes the comparatively high standard of civilization of the Yakuts in the 17th century and their relationship with Russian colonists. Their extensive adoption of Russian words is noted: currently about 2,400, mainly agricultural and industrial terms. Social and economic development of Yakutia is traced from the 17th century to the present. contributions of Tokarev, Okladnikov, Müller, etc., and the difference of historical approach between pre- and post-Revolutionary scientists are discussed. The importance of further study of the Russian contributions in the cultural and political growth of Yakutia is stressed. Copy seen: DLC.

43835. BAKHRUSHIN, SERGEI VLADIMIROVICH. 1882-1950. zhitel'nye rezul'taty russkol kolonizatsii v svíazi s prisoedineniem IAkutii k russkomu gosudarstvu. (In his: Nauchnye trudy. t. 3, pub. 1955. pt. 2, p. 236-53.) Approx. 25 refs. Paper read at the First scientific session of the Yakut scientific research base of the Academy of Sciences U. S. S. R. in July 1947. Also pub. in: Akademifa nauk SSSR. IAkutskii filial. Institut ıazyka, literatury i istorii. Vedushchafa rol' russkogo naroda . . ., p. 49-69. Approx. 50 refs. 1955. Text in Russian. Title tr.: Beneficial results of Russian colonization and the annexation of Yakutia.

Discusses 17th and early 18th century exploration and mapping of Yakutia and Kamchatskaya Oblast', and ethnographic studies of the indigenous population. The discovery and attempted exploitation of natural resources are dealt with: salt (Lena, Vilyuy, Moma Rivers), sulphur (Olekma River), mica (Aldan, Olekma, Chara Rivers), rock-crystal (Ozhogina River), gems and pearls (Okhotsk Sea area). Botanical finds are noted: rhu-

barb and ten new medicinal plants (near Yakutsk and the Aldan River). Russian colonization methods, mixed marriages, introduction of agriculture, and influence of the fur tribute (fasak), paid only by freemen, on the abolition of slavery and transition to a feudal system are dis-Problems of Christianization, cussed. etc., are indicated. The cartographic work of Semen Remezov is stressed: before its discovery by Bering, he marked the Strait separating eastern Siberia from Alaska on his early 18th century map of Kamchatka. 43836. BAKHRUSHIN, SERGEĬ VLADIMIROVICH, 1882–1950. Promyshlennye predprifatifa russkikh torgovykh líudeľ v xvii v. (In his: Nauchnye trudy, t. 2. pub. 1954. p. 225–55.) Refs. Reprinted from: Istoricheskie zapiski, kn. 8, Moskva, 1940, p. 98–128. Text in Russian. Title tr.: Commercial enterprises of Russian merchants in the 17th century.

Discusses the trade and prospecting activities of large mercantile firms, including (p. 227–30) search for walrus tusks in arctic seas, sable trapping on the Olenek and Lena Rivers, and import of foreign goods via Arkhangel'sk.

Copy seen: DLC.

43837. BAKHRUSHIN, SERGEĬ VLADIMIROVICH, 1882–1950. Samoedy v xvii v. (In his: Nauchnye trudy, t. 3, pub. 1955. pt. 2, p. 5–12.) 8 refs. Reprinted from: Severnaß Aziß, 1925, kn. 5–6, p. 100–110. Text in Russian. Title tr.: The Samoyeds in the 17th centurv.

Deals with the Nenets (Samoyed) and related forest-tundra and tundra tribes living, roughly, between the Kanin Peninsula (Arkhangel'skaya Oblast') and the Khatanga River (Yakut A. S. S. R.). The ties between various tribes, conflicts for fishing and hunting rights, seasonal migration routes, fur tribute and trade, reindeer herding and clothing are described. Clan and family organization, adoption of children, slavery, servants, authority of the "pater familias," bloodfeud, shamanism, and the progressive unification of clans into tribes are discussed. Some clan names and selected vital statistics are given.

Copy seen: DLC.

43838. BAKHRUSHIN, SERGEĬ VLADIMIROVICH, 1882-1950. Sibirskie slobodchiki; iz istorii koloniza sii Sibiri. (In his: Nauchnye trudy. t. 3, pub. 1955. pt. 1, p. 212–25.) 10 refs. Originally pub. in: Trudy Gos. kolonizafsionnogo instituta, t. 2, Moskva, 1926, p. 127–38. Text in Russian. Title tr.: Free peasant communities of Siberia; from the history of the colonization of Siberia.

Discusses the 17th century peasant colonies, first established in the White Sea and Pechora River areas. Government sponsored and privately formed villages (sloboda) were set up to supply agricultural produce to trade centers (especially Mangazeya on the Taz River) and hunting and trapping outposts on the Yenisey, Lena and Angara. The settlements are described and some selected statistics on the number of households and annual output are given. Problems of administration, relationship between colonists and natives, petitions for additional land grants, etc., are mentioned. Copy seen: DLC.

43839. BAKHRUSHIN, SERGEĬ VLADIMIROVICH, 1882–1950. Torgi gostiā Nikitina v Sibiri i Kitae. (In his: Nauchnye trudy. t. 3, pub. 1955. pt. 1, p. 226–51.) 11 refs. First pub. in: Trudy Instituta istorii RANION, 1, 1926, p. 357–92. Text in Russian. Title tr.: The trading houses of the merchant Nikitin in Siberia and China.

Discusses documents covering the years 1681–1698, dealing with the business transactions of Gavrila Romanovich Nikitin. The trade missions he sent to Siberia for furs, and other raw materials, the establishment of trading posts and depots in Yakutsk and Nerchinsk as clearing houses for his China trade, etc., are included. Some selected statistics on his Siberian trade-turnover, cost of expeditions, duties and taxes paid in Yakutsk, Yeniseysk and Nerchinsk are given.

Copy seen: DLC.

43840. BAKHRUSHIN, SERGEĬ VLADIMIROVICH, 1882–1950. Voennopromyshlennye ėkspedisii torgovykh lūdel v Sibiri v xvii veke. (Istoricheskie zapiski, 1941. t. 10, p. 167–79.) 7 refs. Text in Russian. *Title tr.:* The military character of commercial expeditions to Siberia in the 17th century.

Deals mainly with the exploits of the merchant Erofel Khabarov, one of the first Russian settlers to receive land grants on the Kuta and Lena Rivers. He organized an expedition to the Amur region financing it by raids on peaceful

Yakuts (Olekma River region) and Gilvaks, confiscating their government tribute, holding hostages for ransom, etc. Other expeditions for walrus tusks and furs to the Chûkhcha (Chukcha?), Kovyma (Kolyma?), Anadyr' and Penzhina Rivers are mentioned; occasionally government-sponsored, they were mostly made by free-lance traders or rank-andfile soldiers. The military and predatory aspect of these commercial undertakings is stressed. Copy seen: DLC.

Institut merzlotove-Materialy k osnovam uchenifa o denifa. merzlykh zonakh zemnol kory, 1955. vyp. 2, p. 34-37.) 13 refs. Text in Russian. Title tr.: Gol'dshtein's hypothesis on water migration and ice formation in

freezing ground. This hypothesis, proposed in 1948, was based solely on the theory that moisture migration between frozen and thawed soil strata is a result of differences in osmotic pressure. Investigations of Rode, Abramov, and others from 1936-1953 indicate that cohesion and migration of water in a dispersed medium are caused by surface forces appearing at the division between solid and liquid phases or solidliquid-air. This has no relation to the osmotic phenomenon. Thus all formulas based on Gol'dshtein's hypothesis are considered useless for calculating forces of frost heaving.-From SIPRE.

p. 443-52.)

Contains descriptions of two new varieties and two new combinations of willow.

S. alaxensis var. obovalifolia n. var. occurring in Mackenzie and Keewatin Districts (Great Bear Lake, Baker Lake) are included.

Copy seen: DLC.

43853. BALL, CARLETON ROY, 1873-. Two problems in *Salix* distribution. (Mandroio, July 1949. v. 10, no. 3, p. 81-87, 2 text maps.)

"The first problem is presented by two

unrelated species, having an extremely extended, but fairly continuous, distribution from south to north." S. lasiandra and its variety lancifolia occur from northwestern Mexico to Alaska and Yukon; the total recorded range covers 35 degrees of latitude (34°-67° N.). S. interior and its variety pedicellata range northward from the mouth of the Mississippi (30° N.) across the United States and Canada to slightly beyond the Arctic Circle in Alaska. "The second problem is concerned with two unrelated species which have a fairly extensive, but finally discontinuous, distribution from east to west." Of these two species, S. serrissima occurs commonly from New England and lower Canada westward; northward the range extends to Lake Athabaska and southern Mackenzie. Copy seen: DA.

BALLANTYNE, R. M., and M. C. ANGLIN. The effect of temperature on the stability of packaged ration items from the Canadian five-man Arctic ration pack RPX 1B. Toronto, Apr. 1955. 5, 10 p. tables (Canada. Defence Research Medical Laboratories. Report no. 173-13) 2 refs.

Account of acceptability tests of food items of this ration over a period of two years. The items were stored at 0° F. and 70° F. for two years and at 100° F. for one year. Ten, out of 31 items acceptable initially, were unacceptable after storage for two years. Storage at 100° F. did not prove satisfactory for predicting storage life at lower temperatures and was discontinued after one Copy seen: DNLM. year.

43857. BAL'ZAK, S. S., and others, Editors. Economic geography of the U. S. S. R. American edition edited by Chauncy D. Harris. Translated from the Russian by Robert M. Hankin and Olga Adler Titelbaum. Preface by John A. Morrison. New York, Macmillan, 1952. 620 p. 84 maps, 53 tables. (American Council of Learned Societies Devoted to Humanistic Studies. Russian Translation Project. Series 3.) Other editors: V. F. Vasîtin and ÎA. G. Feigin.

Contains translation (unabridged) of the first volume of a two-volume Soviet textbook for use at university level; the second volume was not available to American translators. This volume is devoted to a general survey of the productive forces of the U.S.S.R. as a whole. It deals first with physical geography, natural zones, and mineral resources. Then follow discussions of the distribution of productive forces in tsarist Russia (with much reference to Communist theory and improvements), principles of socialist distribution of productive forces, and the distribution of population, industry, agriculture, and transport. References to northern areas occur Appended are statistical throughout. tables, tables of equivalents (weights and measures), list of abbreviations and signs, transliteration table, glossary of Russian terms, boundary changes 1939-1945, indexes of citations, persons, plants and animals, place names. With the excep-tion of some statistics, these appendices and indexes were added by the American Nineteen of the maps were compiled for the American edition.

43858. BANFIELD, ALEXANDER WILLIAM FRANCIS, 1918—, and others. An aerial survey technique for northern big game. (North American Wildlife Conference. 20th, Montreal, Canada, 1955. Transactions, p. 519–32, illus. tables.) 13 refs. Other authors: D. R. Flook, J. P. Kelsall and A. G. Loughrey.

Use of aircraft in surveys of mammals is reviewed, and factors to be considered in such surveys discussed: flight patterns, transect, width and their determination, analysis of data, herd counts, use of aerial photography, etc. Conditions as they apply to moose, caribou, white sheep, walrus and musk-oxen are discussed and the method best suited for each species recommended.

Copy seen: DI.

43859. BANFIELD, ALEXANDER WILLIAM FRANCIS, 1918—. The caribou crisis. (Beaver, Spring 1956. Outfit 286, p. 3–7, 3 illus., text map.)

Caribou population on the Canadian mainland between Hudson Bay and the Mackenzie valley was estimated at 670,000 in a preliminary investigation led by the writer in 1949. Mortality figures showed a deficit of about 33,000 animals a year. Survey of northern Yukon was made in 1953, of Baffin Island and northern Quebec in 1954. Resurvey of the Hudson Bay-Mackenzie valley region in 1955 indicated caribou population of 277,000, a decline of 60 percent in six years. Factors responsible for excessive decline are considered: disease, late winter blizzards, wolf predation, human utilization. Waste of caribou by Eskimos and Indians is stressed. Practices which must be curbed by program of conservation education are noted.

diagr.) Ref.

During 1952 and 1953, Hastings C. mk II. aircraft, R. A. F. Transport Command, dropped 143 tons of supplies and fuel at the expedition's advance base "Northice" and (in 1953) at the fuel dump "West Point," both on the inland ice. Supplies had been sent by sea to Thule, then flown to the icecap. Grid navigation and gyro-steering were used throughout the flights, and astro fixes were taken. The dropping zone is described and diagrammed. In 1952, fuel was free-dropped in jerricans, with loss of 19 percent; in 1953, 55-gallon drums were used (with air space to prevent bursting on impact) and free-dropped from 50 ft. Fragile equipment and stores were dropped by parachute from 400 ft. Other supplies were packed in jute sacks and free-dropped from 50 ft. The freedropping technique is described. Comparisons are made with French techniques in Greenland, 1949-1951.

43876. BARNES, CLIFFORD ADRIAN, 1905– , and T. G. THOMPSON. Physical and chemical investigations in Bering Sea and portions of the North Pacific Ocean. Seattle, Published by the Univ. of Washington, Dec. 1938. 37-79, 163 p. charts, maps, tables. (Washington, State. University. Publications in oceanogra-

phy, v. 3, no. 2.) 28 refs.

The oceanographic work performed on two cruises during the summers of 1933-1934, within the area lying generally between 50° and 65° N. lat. and 163° and 180° W. long. is reported. Standard oceanographic measurements were made at a large number of stations, and surface samples were taken between stations. Charts are presented showing the horizontal distribution of the physical and chemical properties for the surface, 25-meter and 50-meter levels. Vertical distribution of temperature and chemical content is graphed for a number of sta-Copy seen: DLC.

43877. BARNES, CLIFFORD ADRIAN, 1905- . Sea ice problems. (In: National Academy of Sciences-National Research Council. Symposium on oceanographic instrumentation under sponsorship of the Office of Naval Research. Rancho Santa Fe, Calif., June 21–23, 1952. p. 85–100.) 24 refs.

Contains outline of sea ice problems and attendant instrumentation. Suitable facilities for sea ice studies are discussed including surface vessels with emphasis on the disadvantages of icebreakers as oceanographic platforms; submarines; aircraft; land and ice vehicles. usefulness of radar, sonar, loran, shoran, and the electronic-position-indicator in navigation and ice detection is assessed, and the physical and chemical properties of sea ice are reviewed in terms of current studies and complications. It is concluded that conventional oceanographic and related instruments can be used for sea ice studies with but little modification; studies of sea ice are not progressing at an optimum rate. Inadequate facilities for contact with ice, failure to use present facilities to their fullest extent, an insufficient number of participating scientific personnel, and lack of formal instruction and training in the field are factors to be considered. An appended discussion by Waldo K. Lyon treats specific field studies of sea ice which require investigation and concludes that the five essential needs are costly, specialized vehicles, submarine and icebreaker; laboratory facilities and studies; first field studies in sea ice dynamics; a

set of equations of state for the phase mixture, sea ice; investigators.

43878. BARNES, DAVID F., 1921-Gravity studies in the Nuna Ramp area. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954. p. 93-104, illus., diagrs.,

map.) 2 refs.

Results are reported of investigations near Thule, North Greenland, made on the approximate shape of the Nuna Ramp drainage channel to determine the causes for irregularities in ice motion and structure, and on ice thickness to estimate the volume of ice flow; and the profiles through the ice and bedrock are given. The sled trail to Alpha was shown to be essentially free of crevasse-forming bedrock irregularities, although there may be some danger due to thin ice (less than 800 ft.) at Mile 26. The Nuna Ramp is a tongue of ice 700-1000 ft. thick terminating in a deep valley continuous with the Twin Lake Valley. The ice forming the Twin Glaciers is 600-700 ft. thick in midglacier. The Nuna Ramp has a larger drainage basin than either of the Twin Glaciers, but much ice in this part of the icecap is diverted toward Molte Glacier by a buried valley at Mile 11 on the trail to Alpha and by a series of buried hills south of Weather Stations 4, 5 and 6. Two heavily crevassed areas were found to exist over steep bedrock slopes covered by thin layers of ice 5 and 8 mi. south of Nuna Ramp. All gravity observations were made with a Worden meter with a special scale. The control points by altimetry are shown on a map of ice surface elevations on Nuna Ramp, as well as gravity contours and profiles. Copy seen: CaMAI.

43879. BARNES, DAVID F., 1921- , and R. J. ZAVADIL. Gravity studies on the Greenland Ice Cap. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954. p. 377-93, illus., graphs, maps, tables.)

Gravity exploration seems to be a promising method for determining areas where there is danger of crevassing. Nearly 600 gravity observations were made along the Transportation Corps trails on the icecap. Sharp bedrock gradients under a relatively thin ice cover were found in the six places where the gravity profiles crossed crevassed areas. Similar conditions were found in another half-dozen areas, which should be searched for crevasses. Almost all existing crevasses and the danger areas occur along the trail between Thule Takeoff and Alpha. Crevasse-forming conditions also exist between Thule Takeoff and Hard Top, and there is a possibly dangerous area just west of Alpha on the trail to Nuna Takeoff. Beyond Alpha the ice thickens rapidly, and there is no danger of crevassing. Beyond Sierra the bedrock surface is extremely flat and slopes gradually downward to sea level at Point X. The ice on the Thule peninsula forms a separate cap and apparently moves northeast into the valley of Moltke Glacier, which stretches far inland towards Sidebriks Fiord on the other side of the peninsula. Gravity and seismic profiles are appended.—Authors' abstract. Copy seen: CaMAI.

43880. BARNES, DAVID F., 1921—, and others. Gravity surveying as a method for determining the relationship between bedrock and ice-surface topographies of an ice cap. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1668.) Other authors: L. D. Taylor and R. J. Zavadil.

Abstract of paper submitted to the Society meeting in Minneapolis, Oct. 31-Nov. 2, 1956. In summers 1953 and 1954, the U. S. Geological Survey made a gravity survey of the Greenland icecap margin near Thule with emphasis on obtaining an approx. gravity contour map. Bedrock and ice surfaces have somewhat similar forms but ice topography is much subdued and influenced by ice movement. When ice is over 3,000 ft. thick, icesurface relief is almost imperceptible.

43887. BARTELS, JULIUS, 1899—. Geomagnetic observations in polar regions. (CSAGI Arctic Conference... pub. in: I. U. G. G. news letter, Sept. 1956. 5° année, no. 15, p. 374–80.)

The instrumentation of a geomagnetic observatory is outlined, and special requirements for polar stations are discussed. A dense network of magnetic stations is required in the polar auroral zone due to rapid ionospheric current fluctuations. It is suggested that a regular program of measuring earth-currents be added to the observations. The most important contribution that polar geomagnetic observations can make to the overall IGY program is the most direct measurement of corpuscular radiation.

43888. BARTH, TOM FREDRIK WEIBY, 1899— . Geology and petrology of the Pribilof Islands, Alaska. Washington, D. C., U. S. Govt. Print. Off., 1956. p. 101–160. illus., maps (2 fold.), diagrs., cross-sections, 7 tables. (U. S. Geological Survey. Bulletin 1028—F. Investigation of Alaskan volcanoes.) 61 refs.

Pribilofs (56°35′-57°11′ N. 169°35'-170°24' W.) consist primarily of basaltic lava flows and sills, with minor amounts of pyroclastic tuffaceous material and intercalated glacial sediments. Fossils range from Pleistocene to Recent. A peridotite basement occurs on St. George Island. Geology of St. Paul, Otter, and St. George Islands is described, then in detail, the petrology of the peridotite, aplite, lava, and pyroclastic deposits, with chemical analyses and discussion of petrogenetic problems of the tuffs, limburgite, and olivine nodules. The Pribilof area was built up in the late Pleistocene by large fissure eruptions. Origin of the glacial sediments on top of the peridotite and among the lava flows has not been satisfactorily explained. Copy seen: DGS.

43889. BARTHOLOMEW, GEORGE A. DELBERT, 1919— and F. WILKE. Body temperature in the northern fur seal, Callorhinus ursinus. (Journal of mammalogy, Aug. 1956. v. 37, no. 3, p. 327–37, illus., tables.)

Contains a study of temperature and temperature regulation of these animals when on land. They were found to behave like typical cold-water animals: the heavy blubber and fur insulation causes over-heating from activities, even at environmental temperatures of around 10° C., with death from heat prostration common. Heat dissipation is performed by the flippers (which have neither fur nor blubber) and through respiration. Pups, which are less well insulated rarely pant but often shiver. The bearing of these conditions to the aquatic and terrestrial distribution, flipper size, vasomotor activity and location of testes, is discussed. Work was carried out in the Pribilof Islands in summer 1951, in collaboration with U.S. Fish and Wildlife Service. Copy seen: DI.

43890. BARTLETT, ROSCOE GARDNER, 1926—, and M. A. MILLER. The adrenal cortex in restraint hypothermia and in adaptation to the stress of restraint. (Journal of endocrinology, Oct. 1956. v. 14, no. 2, p. 181–87, illus., tables.) 16 refs.

Experiments with rats showed a decrease in adrenal ascorbic acid and in cholesterol during restraint hypothermia. Adrenalectomized animals, exposed for a week to light restraint could not maintain their body temperature when restrained in the cold; but administration of cortisone, alone or with DCA, enabled such animals to maintain body temperature in cold environment.

43891. BARTLETT, ROSCOE GARD-NER, 1926—, and others. Comparative effect of restraint (emotional) hypothermia on common laboratory animals. (Physiological zoology, July 1956. v. 29, no. 3, p. 256–59, illus., table.) 6 refs. Other authors: V. C. Bohr and R. H. Helmendach.

An investigation on body temperature drop, in cold environment, of unrestrained, restrained and dead animals. Mice were thermolabile in restrained (as well as in unrestrained) conditions; hamsters were the least thermolabile. The question of emotionality as related to body temperature is discussed. **Copy seen:** DLC.

43892. BARTLETT, ROSCOE GARDNER, 1926—, and others. Gross muscular activity and temperature regulation in the restrained rat. (Society for Experimental Biology and Medicine. Proceedings, July 1956. v. 92, no. 3, p. 457–62, illus.) 7 refs. Other authors: V. C. Bohr, G. L. Foster, M. A. Miller, and R. H. Helmendach.

Account of experiments indicating that body temperature of animals restrained in the cold, is positively correlated with gross body movement. It is therefore concluded that restraint hypothermia cannot be explained as being due to restricted muscular activity.

Copy seen: DNLM.

43893. BARTLETT, ROSCOE GARD-NER, 1926— . Stress adaptation and inhibition of restraint-induced (emotional) hypothermia. (Journal of applied physiology, May 1956. v. 8, no. 6, p. 661–63, table.) 7 refs.

Account of experiments with rats exposed to dual stress of cold and restraint. The rapidity of adaptation to them indicates a familiarity or emotional component in the process. However, this adaptation was lost unless "reinforced" by application of stress. Such adaptation may also protect against temperature drop in this (emotional) hypothermia. Copy seen: DLC.

Institut istorii.) Over 800 refs. Text in Russian. *Title* tr.: History of agrarian relations in Yakutia; from the 1760's to the middle of the 19th century. M. K. Rozhkova, editor.

In three parts: the first (p. 21-106) deals with the fur tax and agrarian reforms in the 1760-70's; the second (p. 107-223) with social-economic relations, and the third (p. 225-334) with agrarian relations at the end of 18th and in the first half of 19th century. Though extensively documented in printed works, the monograph is based chiefly on unpublished materials. It covers in detail the customary regulations and legislation on land use and ownership and the actual state of, and changes in agrarian relations during this period. Incidentally to the main theme, material on the ethnographic, economic, administrative and political structure of Yakutia is presented, and conditions of life generally among the main social groups of the Russian, Yakut and Tungus population are indicated. The fiscal laws based on the fur tax (asak) or the so-called "sable-fox system" (sobolino-lis'ia sistema), their (ill) effects, and their reform by the First and Second Fur Tax Commission are explained. The division of Yakutia in districts (ulus) and regions (nasleg), and the importance and functions of native chieftains or "toions" are set forth. The animal husbandry and distribution of pastures, beginning of agriculture, the economic importance of fur-animal hunting and trapping and of the fur trade, are discussed in detail and illustrated by statistical data on population, land held, taxes and on catch of fur-bearers. Supplements (12 in all) include: early description of 18 uluses and winter camps (zimov'ya) in Yakutia, among them Verkhnevilyuyskoye, Verkhneyanskoye, Ust'yanskoye, Kolymskoye, Alazeyskoye zimov'ya (p. 372-74); distribution and amount of fur tax in the Siberian provinces, including Yakutia and Kamchatka (p. 376); amount and value of the fur and ivory trade in Yakutsk in 1838-59, by year and kind of pelt, etc. (p. 390-97); fur prices in Yakutsk 1819-29 (p. 399); glossary of specific terms, p. 402-403. Approx. 150 main publications utilized are listed.

43898. BASHARIN, GEORGIĬ PRO-KOP'EVICH. Zemel'nye otnosheniâ v ÎAkutii v konîse xviii – pervoî treti xix v. (Akademiîa nauk SSSR. Istoricheskie zapiski, 1950. t. 35, p. 127–69, tables.) 17 refs. Text in Russian. *Title tr.*: Land tenure in Yakutia at the end of the 18th - first third of the 19th century.

Deals with the problems of land ownership in Yakutia resulting from the agrarian reform of 1760-1770 which made land tenure by natives dependent upon payment of the fur tribute (fasak). The land allotments to tribute-exempt: resettled Russian peasants, Yakutsk-Irkutsk postal tract employees, priests and monasteries, Cossack soldiers, etc.; and to the tribute-paying Yakuts and Tungus are described. The inequities arising from land distribution based on the kind of fur (sable or fox) delivered, the artificial creation of a landed (rich) and landless (poor) class of natives, etc., are discussed. Selected statistics on the native peoples and on Yakut communities (nasleg) according to the 1822-23 census are tabulated: population, head of cattle, arable land and pastures, total tribute and tribute per person, percentage of landless natives, etc. Data on animalbreeding Tungus clans are given, and the transition from a hunting and fishing to an agrarian economy is noted.

43903. BATES, CHARLES CARPENTER, 1918—. Current status of sea ice reconnaissance and forceasting for the American Arctic. [Washington, D. C., 1956.] 20 p. table. Mimeographed. 13 refs.

Reconnaissance and long-range forecasting procedures developed during the last three years in the North American Arctic are described in detail. Each step in the preparation of the forecast is discussed, including ice-potential computations based on known temperature and salinity conditions in the upper 100 m. of water in autumn; analysis of recent climatic data, historical ice data, and of recent ice formation. The results of long-range ice outlooks for the Newfoundland-Northwest Greenland area for mid-1956 are given, indicating delayed ice disintegration and slower opening to navigation in the Melville Bay area, lesser pack-ice thicknesses off the coast of Labrador, improved ice conditions south of Davis Strait, and accelerated northward recession of the southern ice limit during June-July.--From SIPRE. Copy seen: DN-HO (Case 15).

43904. BATES, CHARLES CARPENTER, 1918—, and B. FONOROW. Ice observations by the 58th Weather Reconnaissance Squadron. [Cambridge, Mass.? 1956.] 6 p. 2 graphs, 6 tables. Typescript.

Describes preliminary analysis (Aug. 6-17, 1956) of time-lapse color photography taken by this Squadron during Ptarmigan Flights north of Alaska in 1952, 1954, and 1955, also oblique still photography taken in 1950 and 1951 and associated track charts. Methods of analysis are described. "Only one phase of the study could be completed in the time available, that of determining an index of miles between leads or other ice openings based on flight paths 18 to 200 miles in length." Conclusions are discussed and recommendations made for future photographic methods and analysis Copy seen: DN-HO.

2 tables.) 11 refs.

Surveys the meteorological program since 1830 when the Office was founded as Depot of Charts and Instruments, and lists some of the meteorological charts and other publications issued between 1844 and 1955, many on arctic areas. Because of greatly increased ice forecasting requirements, the Applied Oceanography and Technical Services Branches of the Division of Oceanography maintain a "running" climatic picture of the North American Arctic, with special attention to air temperatures and wind stresses. Five and 30-day ice forecasts are made. Ice forecasting stations are listed, and future needs noted. Copy seen: DGS.

43966. BATES, CHARLES CARPENTER, 1918- . Sea ice and its relation to surface supply problems in the American Arctic. [Washington, D. C., 1955.]

21 p. Mimeographed. Ref.

Describes development of ice-forecasting techniques and services by the U.S. Hydrographic Office from World War II to 1955; aerial ice reconnaissance and ice conditions in the SUNEC area (Newfoundland north to Alert, Ellesmere Island), and the Canadian and Alaskan Arctic in 1954, also summer-early fall 1955, particularly in Beaufort Sea. Study of sea ice properties and its loading capabilities for aircraft, a U.S.-Canadian project at Hopedale, Labrador, is reported, also survey work to facilitate shipping to DEW Line sites in 1955. Recommendations are made for further study in sea

ice physics and for understanding of the polar pack boundary.

Bd. 6, p. 60–70, diagrs., tables, 3 textmaps.) 26 refs. Text in German. Summary in French and English. Title tr.: The present glacier ice cover of the earth.

The total volume of glacier ice on the earth is estimated at 21,740,000 cu. km. by extrapolating the conditions of the Greenland icecap. The Greenland inland ice covers 12 percent of the earth's glaciation, that of the Antarctic 85 percent. A map showing four altitude profiles through Greenland, and hypsographic curves of the surface and base of the Greenland inland ice are included. Data of a number of investigators on the surface area, mean thickness and volume of ice in Greenland, the Antarctic and other glaciers are tabulated and graphed. Based in part on data of the P.-E. Victor expeditions of 1948-1951.

"Investigations were made along the ice margin at Nuna Ramp (northwest Greenland) and adjacent areas to the south and north during the summer field season (1953) to determine the relation between run-off fluctuations and weather conditions, to observe stream characteristics as they may affect transportation, roads, and bridges, and to find the most practical route to the icecap. The total discharge for the area from July-Sept. was calculated as 567 million cu. ft. of water. During peak discharge in Aug., most streams issuing from the ice became impassable for three to eleven days. Run-off was found to be a function of ablation, which in turn is controlled by air temperatures (degree-hours above freezing). Run-off decreased sharply after Aug. 15 due to the disappearance of the snow cover and the slower rate of melting of ice. Only 15 percent of the run-off occurs between midnight and 6 a. m. due to the decrease in air temperatures at night, making it the most favorable period for transportation. Two definite watershed areas were found: one served by Gash River, the other by Twin Glacier River. The divide between these areas runs up the center of Nuna Ramp and is the best drained access route. The drainage pattern in the ice is subparallel, with few distributaries and tributaries." -SIPRE. Intravenous administration of 5 percent glycine caused a significant increase in the time required to lower rectal temperature of dogs to 26° C. Rewarming time decreased to a similar extent in the treated animals. This behavior in the experimental group is attributed to the increased heat production, due to glycine. The possibility of applying glycine as a thermogenic agent in accidental hypothermia is discussed.

43922. BEHAN, ROBERT L. The Eldorado gravity plant, Port Radium, N. W. T. (Canadian mining and metalurgical bulletin, Apr. 1956. v. 49, no. 528, p. 254-61, 4 illus, sketch map, diagrs.) 3 refs. Also pub. as: Canadian

Institute of Mining and Metallurgy. Transactions, 1956. v. 59, p. 154-61.

Uranium concentrates from Eldorado mine, Great Bear Lake, are products of a gravity plant and a leaching plant. The former, in operation since 1933, produces concentrates through treatment of mine ore, the latter through treatment of mill tailings (D. F. Lillie and R. Tremblay, q. v.). The pitchblende occurs as vein material accompanied by a wide variety of metallic minerals which influence gravity separation. Gravity mill operation, 1933-1955, and the present plant flow-sheet are discussed in some detail. In 1952, reclamation work started on mill tailings hitherto dumped into the lake. The floating dredge and its 24-hr. day, year-round schedule are described, especially means by which its working area is kept free of ice in winter. Transportation problems of the Great Bear Lake region and reconstruction of the mill after the fire in fall 1951 are also dealt with. Copy seen: DGS.

BEHAN, ROBERT L., see also McNiven, J. G., and others. Milling Port Radium. 1956. No. 46553.

43923. BEHLKE, CHARLES E., and B. P. GRAY. A study of floods on glacial streams. Abstract. (In: Alaskan Science Conference . . . 1953. Proceedings, pub. 1956, p. 65.)

Matanuska River is typical of streams deriving their largest floods from glacier melt water during very hot weather. Two plots (not reproduced) show relation of the river discharge to air temperature. Results suggest approach to study of possible floods in other glacier-fed streams.

Copy seen: DGS.

43924. BEHMANN, F. W., and E. BONTKE. Intravasale Kühlung; eine Methode zur Erzielung steuerbarer Hypothermie. (Pflügers Archiv für die gesamte Physiologie, 1956. Bd. 263, Heft 2, p. 145–65, illus., tables.) 24 refs. Text in German. Title tr.: Intravasal cooling; a method for obtaining controlled hypothermia.

Description of a new method enabling one to attain chosen rectal temperatures and maintain them for prolonged periods with an accuracy of 0.1° C. The cooling and control apparatus are described. The theoretical aspects of cooling by this

method are also discussed.

Copy seen: DNLM.

43925. BEHMANN, F. W. Die Regulierung der Wärmeproduktion bei Auskühlung homoiothermer Tiere. (Naunyn-Schmiedebergs Archiv für experimentelle Pathologie und Pharmakologie, 1956. Bd. 228, Heft 1–2, p. 126–28.) Ref. Text in German. Title tr.: Regulation of heat production during hypothermia of homoiothermic animals.

Contains a discussion of the physicomathematical aspects of heat production in the hypothermic mammal (dog). "Basal," "regulatory," and "total" heat production are defined and analyzed their mutual relation formulated, and dependence on regulating factors outlined.

Copy seen: DNLM.

43926. BEHMANN, F. W. Wärmebilanzen bei künstlicher Hypothermie; ein Beitrag zum Problem der Ökonomie des Kältezitterns. (Pflügers Archiv für die gesamte Physiologie, 1956. Bd. 263, Heft 2, p. 166–87, illus., tables.) 34 refs. Text in German. Title tr.: Heat balance during artificial hypothermia; a contribution to the economy of shivering.

Contains a comparative and mathematical analysis of heat balances in hypothermic dogs with and without thermal regulation. The animals were cooled by intravasal method to a rectal temperature of 37°-25° C., environmental conditions remaining constant. The effect of intracorporeal cold stimulus and appearance of shivering in these conditions, thermal value of shivering, heat loss, insulating value of skin; circulation, etc., are studied and discussed.

Copy seen: DNLM.

43927. BEIRNE, BRYAN PATRICK, 1918—. Leafhoppers (Homoptera: Cicadellidae) of Canada and Alaska. Ottawa, 1956. 180 p. 1277 illus. (Canadian entomologist, v. 88, suppl. 2) 68 refs. Issued also as: Contrib. No. 3360, Entomology Div., Sci. Service, Dept. of Agriculture, Ottawa, Canada.

Contains notes on types of distribution, bionomies, and on economic importance: leafhoppers feed on mesophyll tissues of host plants, 'producing a mottling and spotting of leaves; they also transmit virus diseases. Collecting and preparing of specimens is discussed. Taxonomy and keys are given, followed by a systematic annotated list of about 480 species. Some new species, mostly of the genera Empoasca or Erythroneura, await description when the groups are revised. Synonyms, short descriptions, illustrations,

measurements, also data on habitat, distribution and host plants are supplied. Many species, native to all sections of Alaska and northern Canada, are included.

43928. BEITO, OLAV T., 1901—. Norske saeternamn. Oslo, H. Aschehoug; Cambridge, Mass., Harvard University Press, 1949. xvi, 339 p. 4 maps. (Institutet for sammenlignende kulturforskning. [Publikationer.] Ser. B., skrifter 45.) 150 refs. Text in Norwegian. Title tr.: Norwegian saeter names.

In Norway, pasturage and care of cattle is carried on at a distance from the animals' winter quarters. The term "saeter", used to designate such ranges, is commonly but not necessarily a part of the name. Some 49,000 of these names are cataloged, analyzed, and grouped with respect to origin, meaning, and historic and geographic significance. There are scattered references to North Norway where nearly 600 such names are known.

43929. BEKKER, MIECZYSLAW GREGORY. A proposed system of physical and geometrical terrain values for the determination of vehicle performance and soil trafficability. (In: U. S. Office of Ordnance Research. Interservice Vehicle Mobility Symposium, 18–20 Apr. 1955. v. 2, Papers, p. 14–28, diagrs.) 17 refs.

The physical properties of soil and snow and the geometrical properties of snow as related to locomotion are discussed. Physical values which describe soil from the trafficability point of view may be said to include angle of friction, cohesion, moduli of sinkage, exponent of sinkage, and exponent of shippage. The geometry of soil is fully described by surface obstacle height and length, and a strainstress diagram.

43930. BEKKER, MIECZYSLAW GREGORY. Theory of land locomotion; the mechanics of vehicle mobility. Ann Arbor, University of Michigan Press, 1956. x, 520 p. illus., diagrs., graphs. 346 refs.

The physical relationship between a vehicle and its environment, particularly in off-the-road locomotion, is treated in detail on the basis of original investigations and the literature. The history and development of various vehicles, and their form as related to environment are outlined. Treatment of soil and snow

mechanics (p. 103-185) covers stability and elasticity problems; time stress, and load factors; pressure distribution in snow, under rigid structures, and in soils; plasticity problems; general snow problems (shear strength, relaxation, changes in mechanical properties, and frictional properties); elastic deformation and settling of the ground; and non-elastic settling of soils. The mechanics of wheels on various surfaces are considered, and the characteristics of crawlers on track-laving vehicles are examined (p. Skis, sleighs, and toboggans are discussed (p. 289-311) including pressure distribution beneath a ski, load-bearing capacity, sliding resistance due to snow compaction, viscous drag, dynamic resistance of sliding, total sliding and total sliding resistance, definition of snow conditions, and form of a ski. The mechanics of various motor vehicles (including tracked and amphibian vehicles, propeller-driven sleds) are considered. The trafficability of soils, vehicle performance, and the economy of locomotion, and a classification of soils and snow is given. Scale-model testing and dimensional theory are discussed. -From SIPRE. Copy seen: DLC.

BELIAEV, P. 43931. 0 laĭkakh. (Okhota i okhotnich'e khozialstvo, Oct. 1956. no. 10, p. 31-32, illus.) Text in Russian. Title tr.: Siberian sled dogs. Appeal for measures to keep a pure breed of this valuable draught dog. A special commission headed by F. S. IAkishin was sent to Yakutia to study the sled-dog problem in 1953(?) by the Main Administration of Hunting Trade and Preserve (Glavnoe Upravlenie Okhotnich'ego khozíalstva i zapovednikov).

43941. BELMONT, ARTHUR DAVID, 1920— . Lower tropospheric inversions at ice island, T-3. Montreal, Aug. 1956. 6 p. l., 57, [42] l. diagrs., charts, map. (McGill University. Arctic Meteorology Research Group. Publication in Meteorology no. 4.) 45 refs. Scientific report no. 2, contract no. AF19(604)-1141; research sponsored by Geophysics Research Directorate of the U. S. Air Force Cambridge Research Center.

Contains results of an analysis of thermal inversions occurring below 700 mb based on the first two years of radiosonde observations made from T-3. The inversion was selected because it is one of the most characteristic features of the structure of the arctic atmosphere. An objective classification system for inversions is introduced to permit exact determinations of type, magnitudes of component layers, and frequencies of occurrence. Some new relationships of inversion characteristics are presented, and a general qualitative theory is suggested to explain the differences found with earlier theories.

Over 400 (On added title: Arkticheskii refs. nauchno-issledovateľskiľ institut Glavnogo upravlenifa severnogo morskogo puti Ministerstva morskogo flota SSSR. Istorifa otkrytifa i osvoenifa severnogo morskogo puti, tom 1.) Text in Russian. Title tr.: Arctic seafaring from ancient times to the middle of the 19th century. Edited by IA. IA. Gakkel', A. P. Okladnikov, and M. B. Chernenko.

First volume of the History of the discovery and utilization of the Northern Sea Route, a work projected in several volumes (cf. p. 5-6) under auspices of the Arctic Institute and in preparation

by a group of its scientists. This volume is in two parts: I, The beginning of the arctic seafaring; geographical discoveries in the North in the 15–16th centuries (chap. 1–13, p. 21–224); II, Exploration of the arctic seas in the 18th and the first half of 19th century; attempts to establish regular transportation on the Northern Sea route (chap. 14–22, p. 227–514).

Pt. I outlines history of Russian expansion in the European and Asiatic North, including early expeditions westward and eastward of the White Sea, penetration to northwest Asia, conquest of Siberia, rise and fall of Mangazeva and Turukhansk; appearance of Russians in Taymyr and expansion to the Lena basin; first voyages in the East Siberian and Chukchi Seas and the expedition of Dezhnev; penetration to the Okhotsk Sea and conquest of Kamchatka. Early Russian boats (lod'a, koch, etc.) are described, and their adaptation to arctic seas is given in detail in chapter on arctic shipbuilding (p. 188-215). Pt. II deals with expeditions sent to investigate the northern maritime areas of Europe and Asia, including IA. A. Elchin's expedition of 1716-1720 to Kamchatka ("Bol'shoi Kamchatskii narad"), the so-called first Bering Expedition 1725-1730, expeditions of Shestakov and Pavlutskii, Fedorov and Gvozdev; the Great Northern (or second Bering) Expedition and achievements of its various parties; round-the-world voyages to Kamchatka and Alaska; investigations of Novaya Zemlya by Chirakin, Rozmyslov, Ludlov and Pospelov, Lazarev, Litke, Pakhtusov, Baer, TSivol'ka and Moiseev: exploration of the northern seas and their coasts by Shalaurov, Liakhov, Andreev, Leont'ev, Billings and Sarychev, Ivanov, P. Kruzenshtern, Anzhu, Vrangel' and Matûshkin; journeys of Gedenshtrom and Middendorff, etc. This concise but detailed chronicle is based to a large extent on unpublished materials; each stage of the gradual Russian expansion is thoroughly documented and the book is a reference source for its subject. Hitherto little known events have special attention as, for instance, I. B. Sindt's expedition to the northwest coast of America in 1764-1767 (p. 417-21).

Appended are: a chronology to 1860 (p. 521-33); list of basic (Russian) publications on the "precapitalistic" period (over 400 items); archives with principal arctic collections; personal names (ca.

1,500) and geographic indexes. Illus. include reproductions of many early and unpublished maps. N. I. Bashmurina participated in preparation of the chapter (22) on the first half of XIX century, and of the appendices.

43945. BELOV, N. A. Results of the study of bottom deposits. Washington, D. C., 1956. 37 p. diagr., map, tables. (In: Somov, M. M. Observational data . . . drifting station 1950–1951, pt. 4;

translated by David Kraus.)

Account of investigation of bottom cores collected by drifting station North Pole-2 in the Arctic Basin over an area and period as in Brodskii and Nikitin's report on the hydrobiology, q. v. Information and data are presented on the coring equipment and technique, and processing methods applied: granulometric, mineralogical, physical, chemical and microfaunistic. Detailed results obtained by these methods are presented in appended tables (paged 489-532 from the original Russian edition) which also give information on the general character of deposits at each station. The course of the drift permitted study of the changes in sediments on passing from the continental slope to the deep sea, and revision of our knowledge on their distribution and that of the extent of the continental slope in general. The age and physicogeographic changes in the sediments were also determined. Copy seen: CaMAI.

43957. BENGTSSON, SIMON FRED-RIK, 1860–1939. Sjösländor: Plecoptera. (*In:* Sjöstedt, Y. Insektfaunan inom Abisko nationalpark, III, *pub.* in Svenska vetenskapsakademien. Skrifter i naturskyddsärenden, 1931, nr. 18, p. 58-60.) Text in Swedish. Title tr.: Stoneflies:

Plecoptera.

Four families of Plecoptera, and small numbers of 15 species, are identified from collections made in the Abisko National Park and environs, mostly by K. H. Forsslund in summers 1928-1930. Dates. associated vegetation, and locale are cited. Copy seen: DLC.

43958. BENJAMIN. HIRAM BER-NARD, 1901-, and others. thermia by internal cooling. (Science, June 1956. v. 123, no. 3208, p. 1128-29, illus., table.) 4 refs. Other authors:

H. K. Ihrig and W. Zeit.

After discussing the disadvantages and risks of hypothermia produced by external cooling, the authors present a method of cooling the circulating blood and through it the organism of the experimental animals (dogs). Rewarming is also performed by this method, which is claimed to produce no fibrillation, shivering or shock symptoms. Copy seen: DNLM.

43959. BENNETT, R. E., and A. FIND-LAY. Voyages to Churchill. (Marine observer, July 1956. v. 26, no. 173,

p. 161-62, table.)

Contains report on the navigation and ice conditions experienced by the S. S. Essex Trader (Capt. Bennett) on two voyages to Churchill. Canada in 1955. The first voyage (from Hull) began on July 24 and the second (from London) on Sept. 1. A list of icebergs sighted on the second voyage including size, description, geographical coordinates, and distance seen by radar is included.

43960. BENNINGHOFF. WILLIAM SHIFFER, 1918-, and H. C. ROB-BINS. Botanical investigations. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953,

pub. 1954. p. 119-30, illus.)
"Results are reported of botanical investigations made in relation to problems of geology and glaciology in Twin Glacier Valley, east margin of North Cap, north margin of Moltke Glacier, and Nuna Ramp, northwest Greenland; the plant species found and their distribution are described. Studies were also made on sediments contained in old ice cores taken 26-31 in, below the 15-in, layer contaminated by algal pits. Approximately 75 lb. of clear ice were collected which vielded 1 cc. of solid matter consisting of a few fragments of plant tissue. structureless humic bodies 3-20µ in diam., unidentified invertebrate animal hairs, a diatom Navicula, and mineral grains of various types, including fresh crystals resembling quartz up to 15 µ in greatest dimension, feldspar, and a few dark minerals. No pollen or spores were found. Samples of the sediment in algal pits were examined under the microscope revealing that it was composed of about equal parts of mineral and organic matter. The organic matter was largely in the form of clumps 200-400 µ in diam. of structureless humic material. Attached or enmeshed with the latter were filaments of an alga, probably one of the Hormogonales or Myxophyceae. The origin of the humus bodies is unknown, but since similar bodies have not yet been found in terrestrial deposits, it is believed that they represent residue from the algal filaments. Algal pits in excess of about 1 ft. in diam. constitute obstacles to vehicular and foot traffic on the icecap during the melting season."-SIPRE.

BENNINGHOFF, WILLIAM 43961. SHIFFER, 1918- . Vegetation types in the greater Thule area. (In: U. S. Army. Transportation Corps. report, Operation Ice Cap 1953, pub.

1954. p. 443-46, map.)

Preliminary report on the vegetation of the district from Wolstenholme Fiord to Petowik Glacier. It consists mainly of scattered, small, creeping, matted and tufted plants on stony upland surfaces. and boggy meadows of mosses, grasses, and sedges along boulder-filled streams and in sheltered depressions. There are no trees or shrubs in the flora, and closed cover of vegetation occurs in patches that are widely separated. The vegetation is modified or controlled by geomorphic processes acting on soils: frost action, soil creep and flow, wind action, etc. Seven types for upland and five for lowland habitat are presented in table with descriptions and remarks.

BENSON, 43965. CARL. SIDNEY, 1927- , and R. H. RAGLE. Measurements by SIPRE in 1955 on the accumulation markers of Expéditions polaires françaises in central Greenland. mette, Ill., July 1956. 1 p. l., 5, [8] l. illus., diagrs., tables. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. Special report 19.)

Results obtained by a six-man research party (Expedition Jello) of the Snow, Ice and Permafrost Establishment in May-Aug. 1955 are given. The group (senior author, leader) traveled generally eastward from Thule, then south to the French Central Station, then westward, terminating at a point about 180 miles from Søndrestrom Air Base. Glaciological research was the primary purpose. Ram hardness tests were taken, stratigraphic studies were made in snow pits, and accumulation markers were set. Markers placed four-five years earlier by the French were resurveyed, and all prominent markers were extended. Measurements of the relative displacement of the snow surface indicate a decrease in accumulation toward the higher elevations of the interior. Location and accumulation measurements are tabulated.

43968. BERDICHEVSKAÑA, M. E. O stratigraficheskom raschlenenii nizhne-kontinental'noï tolshchi mezozoŵ raiona srednego techeniŵ r. Vilûu. (Akademiŵ nauk SSSR. Doklady, May 11, 1954. nov. ser., god 22, t. 96, no. 2, p. 359-62.) 4 refs. Text in Russian. *Title tr.*: Stratigraphic separation of lower continental Mesozoic strata in the middle course of

the Vilyuy River.

Mesozoic formations of the Vilyuy (64°20' N. 126°26' E.) are discussed on the basis of study of faunal deposits of marine strata. Ages of strata are determined: (1) lower continental level—lower Jurassic, (2) marine level-lower and middle Jurassic, and (3) upper continental -upper Jurassic and Cretaceous. Lithologic and mineralogical studies of the deposit indicate the following three levels: sub - conglomerate, conglomerate and supra-conglomerate. These divisions are discussed in detail. Composition of the sub-conglomerate level indicates different conditions for its formation. This level can be separated from the lower continental complex. Copy seen: DLC.

43969. BEREGOVAÂ, N. A. O putîakh i sledakh zaseleniîa chelovekom territorii Alfaski. (Leningrad. Universitet. Uchenye zapiski, no. 115, 1950. Fakul'tet narodov Severa, vyp. 1, p. 57–63.) Text in Russian. *Title tr.*: Routes and traces of man's settlement of Alaskan territory.

Reviews American and Russian investigations (1926–1947) on the early settlement of Alaska and supports the theory of immigration from Asia across Bering Strait during the ice age or early postglacial period. Finds of Pleistocene and Folsom artifacts in the western United States, Alaska and Canada are noted, and the archeological excavations of: A. Hrdlička (1926 and 1929), Pennsylvania

University (1935), Collins (1937), American Museum of Natural History and University of Alaska under Fr. Rainey (1936-37), the "Campus site" excavations by the University of Alaska (1934-36) and University of New Mexico (1941), the 1942-45 excavations in central Alaska and 1944-45 in the Yukon. While these excavations left unsettled the question of origin (local or Asiatic) of Folsom and Yuma hunting implements, the 1947 excavations of N. N. Levoshin on Chukotka (cf. No. 23816) may supply the link between the ancient cultures of northeastern Asia and northwest America. Paper presented at the Northern Conference at Leningrad University, Dec. 10-14, 1947. Includes reference to research in northern Sweden where phosphorus and potash have been found the most deficient nutrients in bogs.

Copy seen: DA.

**43972. BERG, GÖSTA, 1903**– . Snöskor och trygor; några nya rön och iakttagelser. (På skidor, Föreningen för skidlöpningens och friluftslivets främ-

jande i Sverige. Årsbok 1953, p. 167-Title tr.: 71, illus.) Text in Swedish. Snowshoes; some new discoveries and observations.

Two main types of snowshoe are found in Sweden. Besides Scandinavia, Finland and the Baltic countries, both are in the Pyrenees, Switzerland, the German Alps and the Balkans. Snowshoes are also found in northeast Asia and in America. The snowshoe is regarded as very old but a pre-snowshoe period is thought to have existed (Gudmund Hatt and Kai Birket-Smith). John M. Cooper's views are noted: that the invention of the snowshoe occurred in various places in remote times; that people had lived in the tundra areas for no appreciable time before the snowshoe was invented. Discoveries of bog shoes in Ireland and Holland are mentioned and the question is raised of which was earlier, snowshoe or bog shoe. Copy seen: DLC.

BERG, LEV SEMENOVICH, 43973. 1876-1950. Izbrannye trudy, tom 1, istorifa nauki. Moskva, Izd-vo Akademii nauk SSSR, 1956. 395 p. illus., ports., maps (5 fold.) (Akademia nauk SSSR) Refs. Text in Russian. Title tr.: Selected works, vol. 1, history of science.

Thirty papers of this leading Soviet geographer, originally published during 1918-1951, are reprinted in this volume. They deal with Russian geographical investigations and explorations, several of them relevant to arctic studies, viz.:

Otkrytifa russkikh v Tikhom okeane (Russian discoveries in the Pacific Ocean), p. 11-26. No. 1396 and 20602A of Arctic Bibliography.

BERGER, W., tr., see Al'banov, V. I. Im Reich des weissen Todes. 1956. No. 43553. 43979. BERGERON, ROBERT. Preliminary report on Harveng Lake area (west half), New Quebec. Quebec, 1956. 5 p. fold. map (Quebec, Province, Dept. of Mines. Geological Surveys Branch. P. R., no. 320) 2 refs.

The area, 58°15′-30′ N. 69°45′-70° W. (about 55 mi. northwest of Fort Chimo and 16 mi. south of Leaf Lake), forms part of the Labrador geosyncline (cf. No. 33561). Bedrock consists of a series of highly folded sedimentary and volcanic rocks intruded by gabbro sills, all Precambrian in age. Major structural feature is a syncline overturned toward the west, the fold axis trending north-northwest. Mineralized zones containing pyrrhotite, pyrite, and chalcopyrite have been found in the gabbro. Investigations by three mining companies in 1955 are noted.

43980. BERGERON, TOR. Den svenska vårens väder och klimat. (Svenska turistföreningen, Stockholm. Årsskrift, 1952, p. 239–56, 3 illus., 3 diagrs., 3 termaps.) Text in Swedish. *Title tr.:* Swedish spring weather and climate.

Characteristics and determinants are given of spring conditions in the country as a whole and in its major subdivisions. Attention is directed to the changes, with depth, in the atmosphere and the reasons therefore. Effects are noted of Atlantic and Russo-Siberian polar fronts, the spring dry season, common differences in wind direction in different sections, and proximity to cold sea water. Northern sections of the country are least affected by night frost in spring because real spring coincides with long days.

Copy seen: DGS.

43981. BERGERON, TOR. Vinterväder. (Svenska turistföreningen, Stockholm. Årsskrift, 1955, p. 261–78, 2 illus., 10 text maps.) Text in Swedish. Title tr.: Winter weather.

Winter in Sweden, often partly snowless, is reckoned climatologically as the time of year with average temperature below 0° C., usually not a single unit of time. The author believes that "winter" should coincide with snow cover, and so include those early weeks of "spring" when the snow is still deep. On that basis "winter" would last about 40 days, and in northwestern Lapland eight months. Three maps from the Atlas of Sweden illustrate this argument. Relationships between arctic, Atlantic, tropic, and polar air masses over Sweden, also weather conditions in various parts of the country, and differences in snow cover in Scandinavia on the last day of February in successive years (2 maps) are likewise shown.

43988. BERGOUNIOUX, FRÉDÉRIC MARIE, and A. GLORY. Les premiers hommes, précis d'anthropologie préhistorique. 4. éd. entièrement revue. Paris, Didier, 1952. 545 p. illus., maps, tables, graphs. Over 350 refs. Text in French. Title tr.: The first men, a summary of prehistoric anthropology. 4th ed. completely revised.

Discusses fossil man and prehistoric as well as modern races with scattered information on arctic regions. The physical characteristics of present-day Lapps (p. 41), Eskimos and Paleo-Siberians (p. 45) are given. The Quaternary glaciation of Europe including northern Scandinavia, Finland, Kola Peninsula and White Sea coast is mapped (p. 101). The fauna, flora and artifacts of the reindeer age are described (p. 227-60), the mammoth and reindeer representations reproduced. The paleolithic throwing stick (p. 238,

illus. p. 243) and the Aurignacian hutbuilding technique of the Baykal region (Mal'ta and Buret') are compared with those of modern Eskimos (p. 262). The discovery of the Aurignacian so-called "Venus" statuettes at Mal'ta (near Irkutsk) is mentioned (p. 245).

43989. BERGQUIST, HARLAN RICHARD, 1908- . Microfossil zones in Cretaceous rocks of northern Alaska. (Geological Society of America. Bulletin, Dec. 1956, v. 67, no. 12, pt. 2, p. 1670.)

Abstract of paper submitted for Society meeting in Minneapolis, Oct. 31–Nov. 2, 1956. Study of several thousand outcrop and well samples from U. S. Navy's oil exploration in northern Alaska demonstrates traceable microfossil zones within Cretaceous strata (early Albian to Campanian). Characteristic fossils of eight formations are noted.

43990. BERGSLAND, KNUT, 1914—. Hvordan den nye samiske rettskrivningen ble til. (Sameliv; Samisk selskaps årbok 1951–1952, p. 28–50.) Text in Norwegian. *Title tr.*: How the new Lappish orthography was created.

Contains an historical survey of the development of Lappish orthography in Norway and Sweden with examples from different periods. Contributions of Rasmus Rask, N. V. Stockfleth, J. A. Friis and Konrad Nielsen are noted, and details of their systems given. Lappish books approved for use in the schools must adopt the orthography established in 1947. It is the result of Norwegian-Swedish cooperation and is based on the Kautokeino dialect. Copy seen: DLC.

43991. BERGSLAND, KNUT, 1914—. Røros-lappisk grammatikk; et forsøk på strukturell språkbeskrivelse. Oslo, H. Aschehoug & Co.; Cambridge, Mass., Harvard University Press, 1946. xvi, 312 p. illus. (Instituttet for sammenlignende kulturforskning. [Publikationer] Serie B: skrifter 43.) 66 refs. Text in Norwegian. Title tr.: Røros-Lappish

grammar; an attempt at structural language description.

Analysis of the Lappish language is complicated by the existence of eight recognized dialects, generally grouped as northern and southern. Røros Lappish, spoken in the eastern upland of central Norway, is of the southern group. Letter and word sound, meaning, accent, and rhythm which vary in individual speech or dialect are distinguished from structural differences between dialects. Nominal, verbal, and other structural groups are discussed.

43992. BERGSTEN, FOLKE. A contribution to the knowledge of the influence of the Gulf Stream on the winter temperature of northern Europe. [Stockholm, 1936.] p. 298–307, maps, tables. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, serien uppsatser, no. 10.) Reprinted from Geografiska annaler, 1936, heft 3–4.

The mean temperature of the surface water for April-Oct. in the area 59°-61° N. 10°-30° W. is correlated with the following mean winter temperatures for 18 European stations for the period 1900-1934. Isolines of correlation coefficients are mapped and the values for each station tabulated. The largest correlation, about 0.40, occurs in the ocean area between Iceland, Scotland, and northwestern Norway, diminishing rapidly over Scandinavia. The results indicate that practical forecasts cannot be made of the severity of the European winter based only on the preceding summer temperature of the Gulf Stream.

4393. BERGSTEN, FOLKE. Undersökningar rörande sekulära ändringar i avrinningen i vissa svenska vattendrag med särskild hänsyn till frågan om ändringar i nederbördsklimatet. Stockholm, 1941. 9 p. diagrs., table. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, serien uppsatser, no. 36.) Text in Swedish. Summary in English. Title tr.: On possible annual variations of the flow of Swedish rivers and some consequences as to the climate of precipitation.

Discharge data for several Swedish stations for periods of record varying from shortly after 1800 to 1937 are analyzed. Results of the analysis show that no discernible change in the river flow has occurred in central and southern

Sweden during the period under study. Short-period data (40 years or less) for the northern part of the country makes a similar study invalid.

Copy seen: DWB.

43994. BERGSTEN, FOLKE. Vårflödet i norrländska vattendrag samt i Dalälven och Klarälven. Stockholm, 1940. 14 p. maps, tables. (Sweden Meteorologiska och hydrologiska institutet. Meddelanden, bd. 7, no. 7.) Text in Swedish. Summary in English. Title tr.: The spring flood in Norrland watercourses and in the Dal and Klara Rivers.

Data from 112 hydrological stations in northern Sweden are given on peak flows during the spring. Tabulated data include maximum and minimum stage levels, area of the drainage basin, percentage lake area in each basin, period on which peak flows are based, zero level of the gauge, mean and mean winter low-water stages. The mean beginning time of high flows and time of maximum flow are mapped. Flows in the far North of the area begin in early May while in the south at the beginning of April.

43998. BERKHIN, S. I. Vlifanie stepeni dispersnosti na kharakter rentgenogrammy muskovita. (Akademifa nauk SSSR. Doklady, July 11, 1953. nov. ser., god 21, t. 91, no. 2, p. 389-91, table.) 4 refs. Text in Russian. *Title tr.*: Influence of degree of dispersion on the character of the X-ray diagram of muscovite.

X-ray investigation of muscovite from Kola Peninsula is described. Specimens were ground in the agate mortar and grinding ball mill. Fractions of particles from 2 to  $0.2\mu$  and less than  $0.2\mu$  were elutriated in water and subjected to Xray analysis for comparison of characteristics. Method of grinding affects the X-ray diagram characteristics. Muscovite ground in a ball mill has larger background on X-ray diagram and lines of interference of lesser intensity. Distance between planes of particles elutriated in water are enlarged by its penetration. Results of the analysis are assembled in table. Copy seen: DLC.

44001. BERNE, ROBERT MATTHEW, 1918— . Coronary blood flow during hypothermia. (*In:* National Research Council. Division of Medical Sciences. The physiology of induced hypothermia . . . symposium, Oct. 1955, pub. 1956. p. 165–69, illus.)

Account of experiments with dogs cooled to 20° C. It was found that coronary blood flow was fairly well maintained during hypothermia, while aortic pressure reached very low levels. The problem of ventricular fibrillation was also studied.

\*\*Copy seen: DLC.\*\*

44002. BERNE, ROBERT MATTHEW, 1918— . The effect of immersion hypothermia on coronary blood flow. (Circulation research, May 1954. v. 2, no. 3, p. 236–42, illus., tables.) 13 refs.

In deeply hypothermic dogs, resistance in the coronary vascular bed was found to be reduced and flow continued even at very low aortic pressure. Artificial acceleration of the heart at constant coronary perfusion pressures produced a decrease in coronary blood flow. Epinephrine produced brief improvement in blood pressure and coronary circulation but was followed by ventricular fibrillation.

44011. BERTON, PIERRE, 1920 - . The mysterious North. New York, Knopf, 1956. 345, xv p. 24 illus., 6 text maps.

Narrative of the writer's several crips into the Canadian North between World War II and 1955 and his early years in the Klondike, a second generation sourdough. He stresses that several "Norths" exist between Alaska and Ungava, each distinct in climate topography, economic and social structure. These he describes: the land forms, settlements, population, cultural and economic conditions, etc., in the course of recounting his travels. His flights to the "Headless (or Deadman) Valley" of the

South Nahanni River (southwest Mackenzie District); to Whitehorse and Dawson City (Yukon Territory); and a trip on the Alaska Highway from Whitehorse to the Alaska border and return to Dawson Creek, B. C. are related. He flew via Churchill and Coral Harbour to Pond Inlet on northern Baffin Island in June 1954, and across Labrador-northern Quebec to Frobisher Bay in Apr. 1955 on a supply trip for the DEW radar line. He made a trip on the Quebec North Shore & Laborador Railway from Seven Islands to the Knob Lake iron-mining region; a flight to Aklavik on the Mackenzie Delta, across the delta, south along the Mackenzie, east to Great Bear Lake, north to Coppermine on the arctic coast, south to Yellowknife and Pine Point. He traveled by tug on Great Slave Lake and Mackenzie River; made a flight northeast from Yellowknife across the Barren Grounds of Keewatin, etc. Copy seen: DLC.

44017. BEZRUKOV, P. L. Nekotorye voprosy osadkoobrazovaniâ v Kurilo-Kamchatskoï vpadine. (Akademiâ nauk SSSR. Sovet po seismologii. Bûlleten', 1956. no. 2, Sbornik statel po îsunami, p. 43–51.) Text in Russian. *Title tr.:* Some problems on the sedimentation in the Kuril-Kamchatka depression.

Studies of oceanic deeps from the viewpoint of geology, morphology and oceanography are reviewed, especially those in the Sea of Okhotsk, and the Kuril-Trench area. Investigation of deep water sedimentation is described, not only as it results from seismic disturbances during many geological periods, but also to elucidate problems of heat exchange between lithosphere and hydrosphere, of circulation of ocean water at great depths and questions of the origin and history of spreading of marine fauna. The Kuril-Kamchatka are is located in the zone of recent active tectonic movements and mountain formation, its exploration was carried on from 1949 to 1954 by the Academy of Sciences' Institute of Oceanology's research vessel Vitiaz'. In addition to bathymetric work, bottom sediments were sampled at various depths in the Sea of Okhotsk and the North Pacific, and data obtained on the composition and the metallic and mineral components of the water, also on the organic and non-organic sediments. Sponges, molluscs, bottom forminifera, pearlweeds, corals, etc., were found at the lesser depths as well as other types of sediments mentioned in the text.

44018. BEZRUKOV, P. L., and G. B. UDINTSEV. Novye dannye o geologicheskom stroenii dal'nevostochnykh morel. (Akademiña nauk SSSR. Doklady, July 11, 1953, nov. ser., god 21, t. 91, no. 2, p. 359-62, map.) 4 refs. Text in Russian. Title tr.: New data on the geological structure of the Far Eastern Seas. English translation by E. R. Hope, was pub. by the Canadian Defence Research Board as its Defence Scientific Information Service, T 217 R, July 1956, p. 1-4 (copy at CaMAI).

Deep-water geological studies by the Institute of Oceanology, Academy of Sciences, U. S. S. R., are described. New technical equipment and methods used include self-recording sounding devices

and deep-water sampling tubes 34 m. long for collection of bottom sediments. Depths of the Okhotsk, Bering and Japanese Seas, also part of the Pacific Ocean are determined (map p. 360). Maximum depth of the Sea of Okhotsk was found to be 3,370 m., Bering Sea 4,500 m., and the Sea of Japan 3,000 m.; the Pacific was found to be 8,000 m. deep east of the Kurils, 6,670 m, further east, and 8,000 m. south of the Aleutian Islands. The bottom sediments of these seas indicate structures varying in different localities. Materials for further study of island formation processes in the Pacific are represented in new data on the geological structure of these seas.

1.

Contains an interim review of the family north of Mexico, with historical notes, explanation of taxonomic characters, keys and a systematic annotated list of about 80 species. Chrysopa plorabunda and Charrisii, collected by R. I. Sailer at Fort Yukon and Kotzebue Sound in July 1951, are included.

Copy seen: DA.

44022. BIETTE, ÉMILE. Prélude à de nouveaux transports arctiques: le passage du Nord-ouest. (Transmondia, May 1955, no. 8, p. 13–17, col. illus., map.) Text in French. *Title tr.:* Prelude to new arctic transportation: the Northwest Passage.

The Northwest is not potentially a trade route like the Northeast Pasage, but it has importance in the event of a war involving North America. Amundsen's east-west traverse of it in the Gjøa 1903–1906 is reviewed. Construction of new American and Canadian ice-breaking vessels, capable of navigating it, are noted: the Northwind, Burton Island, etc.; the Labrador, C. D. Howe, d'Iberville, etc.

44023. BILIBIN, TÜRIİ ALEKSAN-DROVICH. Osnovy geologii rossypei. Moskva, Izd-vo Akademii nauk SSSR, 1955. 471 p., tables, graphs, maps, illus., refs. Text in Russian. *Title tr.:* Fundamentals of the geology of placers.

Contains systematic description of geology of placers. Consideration is given to hydrological, geomorphic, glaciological and permafrost phenomena as related to the origin of the placers (of gold, platinum, cassiterite, wolframite, magnetite, monazite, diamond, ruby, The hydrogeology of sapphire, etc.). valley deposits is discussed (p. 360-81) with attention to thawed and frozen ground, naleds, underground river and lake ice, lenses, etc. Stratigraphy of deposits is outlined with Quaternary chronology of northern Siberian and neighboring regions, including the Aldan, Kolyma, Taymyr, Indigirka, Anadyr' (p. 401-415). The morphology of the placers, distribution and character of their metals is discussed in detail (p. 416-62). Copy seen: DLC.

44024. BILLING, GILLIS. Fjällsport på Spetsbergen. (På skidor. Föreningen för skidlöpningens och friluftslivets främjande i Sverige. Årsbok 1956. p. 61–79, illus.) Text in Swedish. *Title tr.*: Mountaineering in Spitsbergen.

Account of a seven-man party (the author, one Norwegian, five Austrians) sponsored by Section Bergland of Osterreichische Alpenverein 1954. Base camp was established at Fanciullipynten (Cape Fanciulli, 79°10' N. 12° E.) on the east shore of Krossfjorden; tours made by the author and the Norwegian, Per Vigerust, are described in detail. Climbs included Kongen (Le Roi, 1423 m. 79°10' N. 12°30' E.) and Storingen (Le Colosse, 1144 m. 79°20' N., 12° E.). The hot springs of Jotun (79°20' N., 13° E.) on the west shore of Bockfjorden were visited, and the Wergeland mountains (79°10' N. 13° E.) investigated.

Opredelenie modulía deformaísii gruntov, 1955. p. 29–36, graphs.) Text in Russian. Title tr.: Applicability of modulus of deformation to characteristics of mechanical properties of soils and road surfaces.

The design of non-rigid road surfaces using the method of the All-Union Highway Scientific Research Institute is described and compared with others. This method consists of the experimental determination of the yield of the road surface under action of different loads. The relationship between yield and load is expressed by a parabolic curve and is mathematically formulated on the basis of elasticity theory applied within the limits of the compression phase and partial shearing. Static and dynamic loading of the road surface are also discussed.

Also pub. in Forskning og forsøk i landbruket, 1954. bd. 5, hefte 3, p. 219–46, 18 tables. Text in Norwegian. Summary in English. Title tr.: Trials with spring wheat varieties 1948–52.

Trials at five experimental stations in Norway are reported, including those from Vågones, near Bodø, in Nordland. Weather and growth are compared, length of growing period recorded, and various crop results for several spring wheat strains are tabulated. Experiment, economy, and possible differences in location in the North are considered.

44039. BLACK, J. W. The distribution of solar radiation over the earth's surface. (Archiv für Meteorologie, Geophysik und Bioklimatologie, 1956. Bd. 7, Heft 2, Ser. B., p. 165–89, diagrs., table, maps.) 42 refs. Summary in German and French.

Solar radiation and mean cloud amount were related by a quadratic regression, and data of total solar radiation measured on a horizontal surface on a monthly basis and of more than three years' duration were used. The data were obtained from 88 stations including Aklavik, Canada, and Fairbanks, Alaska. Values of total solar radiation were calculated by the use of the equation found for each 5° intersection of latitude and longitude overland, and for each 10° intersection over sea. Isopleths for each successive 50 gcal/sq. cm. day are shown on 12 monthly maps. Copy seen: DLC.

44040. BLACK, ROBERT FOSTER.

1918— Permafrost and water supply
of Point Spencer spit, Seward Peninsula,
Alaska. (Geological Society of America.

Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1672.)

Abstract of paper submitted for Society meeting in Minneapolis, Oct. 31-Nov. 2, 1956. The enlarged northern part of the spit (65°17′ N. 166°50′ W.) is attached to the mainland by a 12-mi. bar. Top of permafrost occurs 3-8 ft. or more from the surface. It rises under the coastal ridges producing a saucerlike layer that traps potable water. Excavation of borrow pits near the sea breached the rim of the layer. Sea water has contaminated potable water on margins of the spit, possibly also in the center.

Copy seen: DGS.

44041. BLACK, ROBERT FOSTER, 1918 - Permafrost as a natural phenomenon. [Washington, D. C.] 1956. iv, 25 p. diagrs., map. (In: U. S. Office of Naval Operations. The dynamic North, v. 2, no. 1.) 107 refs.

Contains a survey of recent literature on various aspects of permafrost including its geological, engineering, and biological significance. Areal distribution of permafrost in the Northern Hemisphere is mapped, and representative cross sections of permafrost areas in Alaska and Asia are given.

Copy seen: DLC.

44042. BLACK, W. A. Extracts relating to the navigability of Canadian inland waterways. Ottawa, Queen's Printer, 1956. 55 p. (Canada. Dept. of Mines and Technical Surveys. Miscellaneous papers series. Geographical paper no. 7.)

Excerpts (15–100 words in length) from published works of travelers, early explorers and fur traders, etc., also government reports, and information from local authorities. They are preserted in a listing of rivers and lakes, and these are grouped according to five major drainage regions: Pacific Coast, Interior Plains, Hudson-Laurentian, Great Lakes-St. Lawrence, and Atlantic Coast. Arctic-subarctic drainage basins are included in the second, third and last of these regions.

Copy seen: DGS.

44043. BLACKADAR, ROBERT G. Geological reconnaissance of Admiralty Inlet, Baffin Island, Arctic Archipelago, Northwest Territories: report, map, and stratigraphic sections. Ottawa, Queen's Printer, 1956. 25 p. fold. map, fold. sections, table. (Canada. Geological Survey. Paper 55–6.) 12 refs.

Contains results of field work in May-

Aug. 1954 by the author and R. R. H. Lemon in the region 71°30'-73°30' N. 83°-87° W., northern Baffin. Some 1000 mi. were covered by dog sled, and a detailed study was made of the Arctic Bay settlement vicinity. History of discovery, accessibility, population, climate, vegetation and game, and topography are briefly described. Bedrock is Archean, Proterozoic and/or Early Cambrian, and Late Ordovician; it includes sedimentary rocks, volcanic flows, highly contorted gneisses, basic dike rocks, and granitic and pegmatitic dike rocks. Except for widespread block faulting (the dominant structural feature) and gentle warping, no orogenic deformation has occurred since the Archean. Quaternary glacial and marine deposits are briefly described. Traces of mineralized rock are widespread in certain areas.

**44044.** BLACKADAR, ROBERT G. "Operation Franklin," 1955. (Arctic circular, 1956. v. 9, no. 2, p. 12–17, text map.)

Describes Canadian Geological Survey's helicopter and ground reconnaissance of 100,000 sq. mi. of the Queen Elizabeth Islands and parts of northwest Baffin, Somerset, and Prince of Wales Islands. Two long-range Sikorsky S-55 helicopters with cruising speed of 72 mph. were used. Some statistics are given on loads and distances. Three base camps and five fuel caches were set up and preliminary ground investigations carried out by geologists with dog teams during May-June. The main survey phase, June-Sept., used nine field parties (11 geologists, 10 assistants). Main camps were moved by helicopter after key sites within 150 mi. radius had been examined, thus progressing systematically through the islands.

**44053.** BLESS, R. C., and others. Eastwest motions in the aurora. (Astrophysical journal, July 1955. v. 122, no. 1, p. 205–206.) 6 refs. Other authors: C. W. Gartlein and D. S. Kimball.

Studies by Cornell University and the National Geographic Society, begun in 1938, indicate that while active auroral forms generally move westward before midnight and eastward afterward, there are many exceptions, that this is a trend rather than the rule. Instances (at least 247) of eastward or westward movement of the aurora were recorded by Carlheim-Gyllensköld (Arctic Bibliography, No. 2874) at Kapp Thordsen (78°20' N. 15° E.), Vestspitsbergen, in 1882–1883. These showed almost no dependence of motion on time. Copy seen: DLC.

**44054. BLOCH, IVAN.** Alaska's power resources, in relation to mineral development. (Pacific builder and engineer, July 1956. v. 62, no. 7, p. 98+, map.)

Contains excerpts from a paper presented at the meeting of the Electrochemical Society in San Francisco in Apr. The hydro-electric potential of southeast and southwest Alaska is discussed, especially, in the former, the Yukon-Taiya project near Skagway. Mineral resources requiring potential power development include magnetite in the Klukwan area near Haines, nickelbearing ores in the Tokobi-Chichagof-Baranof Island area, and copper-bearing ores in various parts of the Archipelago. The largest individual hydro-electric potential in the SW region is that of the Copper River. A tentative list is given of projects in all regions of Alaska with more than 5000 kw. potential. The estimated installed capacity totals 15,673-16,145 megawatts. Copy seen: DLC.

44055. BLOCK, L., and N. HERLOF-SON. Numerical integration of geomagnetic field lines. (Tellus, May 1956. v. 8, no. 2, p. 210–15, tables.) 9 refs.

An electronic computer was used to establish the end points of geomagnetic lines in the Southern Hemisphere, beginning at a number of stations in the North Hemisphere. Knowledge of the location of these corresponding geomag-

netic locations is helpful in establishing magnetic and auroral stations. The results are tabulated showing the geographic and geomagnetic coordinates of starting and ending points on the earth's surface of 123 geomagnetic field lines. Starting points include latitude as far north as 88.6° and include such stations as Thule, Bjørnøya, and Fairbanks.

BLOCKER, T. G., Jr., see Pomerat, C. M. and others. Thermal stress and tissue culture, 5... enhance outgrowth... cold injury ... 1954. No. 47400.

44056. BLOK, GEORGII. Podzemnafa sokrovishchnifsa. (Ūnost', Mar. 1956, no. 3, p. 92–98, illus., map.) Text in Russian. *Title tr.:* Subterranean treasure-house.

Contains brief history of the discovery and exploration of the Kursk magnetic anomaly (Kurskafa magnitnafa anomalifa, KMA) in the U. S. S. R., caused by large iron ore deposits deep underground. Hypothesis is advanced by M. I. Kalganov, chief of Laboratory of Iron Ore Deposits of the Institute of Geological Sciences of the Academy of Sciences (p. 93-95) that these deposits extend northward to the Kola Peninsula and Arctic Basin reaching the submarine Lomonosov Range. Copy seen: DLC.

BLOKH, G., see Budnikov, P., and G. Blokh. Kosvennafa . . . morozostof-kosti . . . materialov. 1956. No. 44181.

Institut ėtnografii. Trudy, 1956. nov. seria, t. 31. Vostochnoslavianskii ėtnograficheskii sbornik, p. 3–458, 120 illus. incl. plans, maps (some fold.), tables.) Refs. Text in Russian. Title tr.: Peasant structures of Russians, Ukrainians and White Russians; communities, housing and outbuildings.

Includes extensive, though scattered, information on 19th and 20th century buildings of northern Russia and Siberia, especially in Arkhangel'skaya Oblast'. The Severnaya Dvina valley villages (p. 30), log house (p. 71, 148) and roofing materials and techniques (p. 100, 107, 109), use of mica for window panes (p. 120), pile-structures on the Suma River (p. 160), etc., are mentioned. The north

Russian two-story house-barn combinations (p. 161-72), house planning and room furnishing (p. 218-19 and map, p. 235) are discussed. Winter and summer fishing and hunting cabins along the Ob' and Yenisey Rivers, on Dikson Island and the Taymyr coast, on Kolyma and Anadyr' Rivers, in Kamchatka, etc. (p. 244-50) are described. Wells and (in permafrost areas) water holes in river and lake ice (p. 291-93), outbuildings, granaries of the far North (p. 308-309) and fish smokehouses in Yakutia and Kamchatka (p. 336-37) are depicted. Decorative wood carving (p. 340, 365) and painting (p. 401), furniture (p. 433), and Russian influence on the native architecture of Siberia, particularly Yakutia (p. 450-51) are included. Indexes of illus. (p. 759-62) and subject matter (p. 767-85) are appended. Copy seen: DLC.

BLOMKVIST, EVGENIÂ ĖDUAR-DOVNA, 1890–1956, ed., see also Zagoskin, L. A. Puteshestviâ . . . 1842– 1844 . . . 1956. No. 49031.

**44058. BLOOD, BENJAMIN D.** Notes on hydatid disease control. (*In:* Alaskan Science Conference . . . 1952. Proceedings, *pub.* 1954, p. 149–50.) 4 refs.

Contains information on the geographic distribution of the disease (worldwide, including Alaska); international cooperation in its combat; the two avenues of interrupting the life cycle of the parasite and thus preventing spread of the disease; successes in Iceland, etc.

Copy seen: DGS.

44059. BLUHME, EMIL, 1833–1926. Fra et ophold i Grønland, 1863–64; uddrag efter lieutenant i Søetaten E. Bluhmes bog. Udg. med en indledning ved Svend Dahl. København, Berlingske bogtr., 1952. 85 p. plates (part col. & fold.). Text in Danish. Title tr.: From a sojourn in Greenland 1863–64; extracts from Naval Lieutenant Emil Bluhme's book; edited with an introduction by Svend Dahl.

Selections from No. 1722 of Arctic

Bibliography. Bluhme's characterization of the Greenlanders and their way of life, shortcomings of the Danish administration of the colony and recommended changes, his criticism of mission and trade practices, etc., are noted by the editor (p. 7–12). Although opinionated and unaware of the nature of future developments, Bluhme had some ideas later put to good effect; e. g. he asserted Denmark's obligation to treat the natives as an equal people. Copy seen: DLC.

leten', 1946. no. 8, p. 46-72, illus., figs., maps incl. 1 fold.) 50 refs. Text in Russian. Summary in English. *Title* tr.: The boundary of the maximum Quaternary glaciation in the Ural Range from observations of the mountain terraces.

The limits of maximum glaciation in the Urals, including the northern part, were studied on a basis of the terraces formed by frost-solifluction processes and their relation to the processes of weathering, erosion, abrasion and karst formation. These terraces diminish progressively from south to north. The boundary of glaciation, with its southernmost part crossing 58° N., is shown (text map, p. 68) as are the boundaries drawn by former investigators between 57° and 62° N. (fold. map). Data on the geomorphology and evidences of glaciation in the Northern Ural are included.

44065. BÖCHER, TYGE WITTROCK, 1909- . Arktisk station på Disko, 50 års jubilaeum. (Grønland, Dec. 1956, nr. 12, p. 457-63, illus.) Text in Danish. Title tr.: The Arctic Station on Disko, 50th anniversary.

Recounts history of the station, founded in 1906 by Morten P. Porsild and taken over by the University of Copenhagen in 1953. Some of the local flora is described: the site and its immediate neighbourhood has a rich one.

Copy seen: DLC.

44066. BOEING MAGAZINE. Cold starter. (Boeing magazine, Jan. 1956. v. 36, no. 1, p. 14-15, illus.)

A brief account is given of testing of a commercial gas turbine-powered air supply cart used to provide compressed air to start the large jet engines of B-52 aircraft. The winterized starter carts performed satisfactorily at temperatures down to -65° F. in the cold chamber at Eglin Air Force Base, Fla. Copy seen: DLC.

44067. BOGACKI, BOGDAN, and others. Badania doświadczalne nad przemianą elektrolitów oraz tlenu i dwutlenku wegla we krwi u psów w obniżonej ciepłocie ciała. (Polski przegląd chirurgiczny, 1956. t. 28, no. 8, p. 895-98, tables.) Text in Polish. Other authors: K. Bentke, W. Jurczyk, and K. Stengert. Title tr.: Experimental studies on metabolism of electrolytes, oxygen and carbondioxide in the blood of hypothermic dogs.

Author found that below 28° C. a significant lowering of vital processes took place. The drop in serum-potassium is not concomitant with an increased elimination through the kidneys, and it is assumed that it moves into the cells. The O2 and CO2 content of the venous blood indicates an increased acidity.

Copy seen: DNLM.

Izvestifa, serifa geograficheskafa, Mar.- Apr. 1956, no. 2, p. 3-5, maps.) Text in Russian. *Title tr.:* Investigations on the research vessel *Vitûa*' in the Pacific.

Explorations during cruises of the Vitāz' during 1949-55 are outlined, including the 21st and 22d, in 1955; the 21st expedition explored the northern part of Kuril-Kamchatka trench and the western part of the Aleutian trench, to 7,200 m. depth. Copy seen: DLC.

44076. BOGOROV, VENIAMIN GRIGOR'EVICH, 1904—. Peculiarities of diurnal vertical migrations of zooplankton in polar seas. (Journal of marine research, 1946. v. 6, no. 1, p. 25–32, diagr., tables.) 17 refs.

Vertical migrations were studied in the Barents and White Seas during summer and in the Barents and Kara Seas during autumn. Such studies in polar areas are of particular value since they permit a ready evaluation of the effects of varying light conditions ranging from uninterrupted daylight to permanent darkness. Diurnal vertical migration in polar seas is subject to great seasonal changes. In summer with continuous daylight, the animals maintain an almost invariable vertical distribution. In autumn with alternating day and night the same animals perform the usual migrations common in lower latitudes.

Copy seen: DLC.

44077. BOGOROV, VENIAMIN GRI-GOR'EVICH, 1904—. Plovuchii institut. (Vokrug sveta, Dec. 1956, no. 12, p. 18–20, illus.) Text in Russian. *Title tr.*: The floating institute.

Popular sketch of oceanographic work in the northwest Pacific by the research vessel Vittaz'. Since 1949, the vessel with her 72-man crew, 60 scientists and 12 scientific laboratories, has made over 3,500 scientific stations on 22 trips, logging some 150 thousand miles. Discovery of the Kuril-Kamchatka Trench and the submarine range Vityaz' and deep-sea investigations are noted. Photographs by N. Zenkevich show the vessel, some equipment (nets, etc.), and faunal specimens. Copy seen: DLC.

44078. BOĬTŠOVA, A. F. Osobennosti v semantike i slovoobrazovanii ėvenkiiskogo glagola v sravnenii s russkim glagolom. (In: Akademiiā pedagogicheskikh nauk RSFSR, Moskva. Institut nafsional'nykh shkol. Rodnol i russkii fazyki . . ., 1956. p. 146–96.) 3 refs. Text in Russian. Title tr.: Peculiarities of semantics and word-formation of the Evenki verb as compared with the Russian verb.

Analyzes the differences and similarities between Evenki (Tungus) and Russian verb usage and morphology. The complexity of meaning and variations in connotation of seemingly analogous verbs are discussed and examples given from verbs of motion, action, speech and thought, etc.

Copy seen: DLC.

**44079. BOLGAROV, N.** Rybozavod v okeane. (Znanie-sila, Dec. 1956. god 31, no. 12, p. 33–38, illus.) Text in Russian. *Title tr.*: A fishing factory in the ocean.

Sketches operations of Soviet fishing trawlers in the North Atlantic and Barents Sea. The 3,670-ton Pushkin with a 2,000 hp engine joined the Murmansk fishing fleet in July 1955. Special features of her construction, trawling methods, and processing facilities are described. Three similar vessels, the Gogol', Nekrasov and Dobrol@bov are already operating in the Barents Sea; 30 trawlers of the same class are to join the Murmansk fleet in 1956 (1957?). This fishery's catch of 7.5 million cwt. is to rise, according to the plans, to 15 millions in 1960.

44102. BOSSOLASCO, M., and I. DAGNINO. Caratteristiche fisico-meteorologiche del manto nevoso. (Geofisica e meteorologia, July-Oct. 1956. v. 4 no. 4/5, p. 96-102, graphs.) 9 refs. Text in Italian. Title tr.: Physical-meteorological characteristics of the snow cover.

The relation between snow-cover characteristics and air temperatures is discussed in detail on the basis of long-period observations. The density of new snow generally decreases with air temperature during snowfall, reaching a minimum at

-11° C. and increases again below -17° to -18° C. Low-density snow is less susceptible to metamorphism than denser snow due to its poor thermal conductivity. Snow densities are usually lowest at 1200-1960 m. elevation in early Jan., increase to about 0.265 gm./cc. in mid-Feb., and reach 0.40 gm./cc. or more before the snow disappears. Snow-cover duration increases by 11-12 days/100 m. elevation. Data on density and shearing and ram resistance are graphed.

44103. BOUGHNER, C. C., and others. Climatic summaries for selected meteorological stations in Canada; volume III; frost data. Toronto, 1956. 94 p. 6 text maps, graphs, tables. 14 refs. Other authors: R. W. Longley and M. K. Thomas.

Tables are based on available data to the end of 1950 for stations with at least two years of record. Stations reporting in main table of frost data include 13 in Yukon, 47 in Northwest Territories, 12 in northern Manitoba, two in northern Ontario, nine in northern Quebec, and ten in Labrador. For each is given: latitude and longitude, elevation, number of years of record, average frost-free period, last frost (spring), first frost (fall), frost-free season-extremes on record. Other tables, with fewer northern stations reporting, contain data on the probability of spring and fall frosts and length of frost-free period, average numbers of days with freezing temperatures. Graphs show percentage frequency of dates of last spring and first autumn frosts by weeks, including Dawson, Fort McPherson, Fort Norman, Hay River, Churchill. Climatic summaries v. 1 and 2, dealing with temperature, humidity, sunshine, precipitation, and wind are listed as No. 2796 and (addendum) 32891 of Arctic Bibliography. Copy seen: DWB.

**44104. BOUILLON, J.** Influence of temperature on the histological evolution of the ovotestis of *Cepea nemoralis* L.

(Nature, London, Jan. 21, 1956. v. 177, no. 4499, p. 142-43.) 4 refs.

Account of experiments with these snails kept at 0°, 6°, 23° C. and at seasonally varying temperatures. Low temperature (0° C.) inhibited all gametogenesis; at 6° C. the development of male germinal cells was inhibited, but development of primary gonocytes in the female direction was favored. Higher temperature promoted development in the male direction.

BOWATER, S., see Hamilton, R. A., and others. British North Greenland Expedition, 1952–4 . . . results, 1956. No. 45412.

**44108.** BOWDEN, FRANK PHILIP, and D. TABOR. The friction and lubrication of solids. Oxford, Eng., Clarendon Press, 1950. xii, 337 p. diagrs., graphs, 33 plates, tables.

Includes a section on "The mechanism of sliding on ice and snow" (p. 65-72) in which the role of frictional heating as compared to pressure melting in the sliding of bodies over ice and snow is discussed on the basis of the literature, theoretical considerations, and various experiments. The results of laboratory tests and calculations indicate that the water film responsible for decreasing friction is formed as a result of frictional heating rather than pressure melting. The lubricating water layer is believed to be produced by friction. Friction rises at lower temperatures due to increasing difficulty for a water layer to form.

44109. BOWLES, K. L., and others. Auroral zone absorption of radio waves transmitted via the ionosphere. [College, Alaska] 1955. 911. illus., diagrs. (Alaska. University. Geophysical Institute. Task E, final report, Mar. 1, 1954–Feb. 28, 1955.) Process print. Other authors: R. B. Dyce and C. G. Little.

The first section describes a series of experiments carried out at College and at Point Barrow, Alaska, to determine the mode of propagation of auroral echoes. The results support earlier theories advanced which postulate an alignment of the auroral scattering centers along the earth's magnetic lines of force. Experiments were also made to study possible relationships between the occurrence of visual auroral forms and of V. H. F. auroral echoes. The results indicated that echo strength is not determined by

the luminosity of the visual forms although the scattering surfaces are located near by. Diurnal and seasonal variations in echo occurrence at College are described and the spectrum of the reflected radio signals is analyzed.

44110. BOYER, MARC. Canada's mineral industry chalks up another record year. (Western miner, Nov. 1956. v. 29, no. 11, p. 33–36, illus.)

Includes mention of current activities in the iron ore regions of northern Quebec; the Sherritt Gordon nickel-copper operations at Lynn Lake, northern Manitoba; the Rankin Inlet nickel mines on the west coast of Hudson Bay; and the Yellowknife gold operations, Great Slave Lake.

Copy seen: DGS.

44111. BOYLE, ROBERT WILLIAM, 1920-, and others. Geochemical investigation of heavy metal content of streams and springs in the Galena Hill-Mount Haldane area, Yukon Territory. Ottawa, Queen's Printer, 1956. 12 p. 3 maps (2 fold.), table. (Canada. Geological Survey. Bulletin 36.) 2 refs. Other authors: E. L. Pekar and P. R. Patterson.

Describes completion of investigations in this lead-zinc-silver region (approx. 63°45′-64° N. 135°15′-136°05′ W.) being southwest of that described in No. 38962. Topography, climate and geological conditions are indicated, also character of the drainage system. Concentration of heavy metals (zinc, lead, copper) was established by the dithizone method. Results indicate that the heavy metal anomalies are centered principally on the belt of quartzites that underlie part of Galena Hill and Mt. Haldane and contain the principal lead-zinc-silver lodes. Prospecting should be concentrated in this belt. Copy seen: DGS.

44112. BOYLE, ROBERT WILLIAM, 1920- . The geochemistry and origin of carbon dioxide, water, sulphur, and boron in the Yellowknife gold deposits, Northwest Territories, Canada. (Economic geology, Jan.-Feb. 1956. v. 51, no. 1, p. 110-111.)

Contains abstract of paper presented at the annual meeting of the Society of Economic Geologists, Feb. 20–23, 1956, New York. Gold deposits of Yellowknife occur either in greenstones or in metasedimentary rocks. "Geochemically, the deposits in the greenstones represent

concentrations of silica, carbon dioxide, water, sulphur, arsenic, antimony, gold, and other metallic elements. Those in the sediments represent concentrations of silica, sulphur, boron, gold and other metallic elements." Formation of both types of deposits is explained.

44113. BOYLE, ROBERT WILLIAM, 1920—. The geology and the geochemistry of the silver-lead-zinc deposits of Keno Hill and Sourdough Hill, Yukon Territory, preliminary report. Ottawa, Queen's Printer, 1956. 78 p. 9 maps (6 fold.), diagrs., 13 tables (1 fold.) (Canada. Geological Survey. Paper 55–30.) 21 refs.

Contains results of author's field work, 1953 and 1954, in the area 63°53′-59′ N. 135°03′-20′ W., thirty-five miles northeast of Mayo. Topography, glacial deposits, frost action, and climate are briefly described. Consolidated rocks belong to the Yukon group (Precambrian or Paleozoic) and consist of schists, phyllites and quartzites with conformable lenses and sills of greenstone (altered diorite or gabbro) in the lower schist and central The mineral dequartzite formation. posits are located in brecciated fault zones cutting the greenstones, quartzites, and phyllites. The fault systems, and the mineralogy and geochemistry of the mineral deposits are described in some detail. Genesis of the deposits is not discussed. Copy seen: DGS.

44114. BRADLEY, JAMES CHESTER, 1884— . The distribution of northeastern insects. (Entomological news, Dec. 1956. v. 67, no. 10, p. 257–61.)

Contains a discussion of the distribution of eleven insects, some occurring in Alaska and northern Canada. The author proposes and defines two terms: "austrad" meaning proceeding toward areas of increasing warmth, and "boread" proceeding toward areas of decreasing warmth. By using these terms and stating the northern limits of distribution also the austral limits, a scientist can indicate more clearly the distribution pattern and faunal affinities.

44121. BRATBERG, ERLING H., 1922- . Ueren og uerfisket. (Naturen, 1956. årg. 80, nr. 2, p. 67–73, 2 diagrs.) Text in Norwegian. *Title tr.:* The rosefish and its fishing.

An international market has been developed recently for this fish, long used as a food fish in Nordland. The variety, Sebastes marinus, is economically interesting; its catch and commercial importance are considered as well as its biology, migrations and reproduction habits. It is found along the coasts of Norway, Novaya Zemlya, Bjørnøya, West Spitsbergen, Jan Mayen, and south Greenland and over large parts of the Barents and Norwegian Seas. Copy seen: DLC.

44122. BRAUER, RALPH WERNER, 1921—. The effect of hypothermia on the isolated perfused rat liver. (*In*: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia... symposium, Oct. 1955, *pub.* 1956. p. 235–42, illus.) 10 refs.

Cooling resulted in rise of blood viscosity which in turn affected the hemodynamics. Chromic phosphate colloid uptake, perfusate glucose levels and bile flow were lowered. The effects of hypothermia on uptake and excretion of sodium sulphobromophtalein disulfonate, are also discussed. Copy seen: DLC.

44123. BRAUER, RALPH WERNER, 1921—, and others. Temperature effects on radiocolloid uptake by the isolated rat liver. San Francisco, Sept. 20, 1956. iv, 16 p. illus., tables. (U. S. Naval Radiological Defense Laboratory. Technical report USNRDL-TR-112 NM006-015. 04.) 13 refs. Other authors: R. J. Holloway and G. F. Leong.

Account of investigations on the effects of lowered temperature (38° to 20° C.) on CrPO<sub>4</sub>-colloid uptake and blood flow of the isolated liver. The Q<sub>10</sub> for the uptake reaction was found to equal 1.92. Cooling was found to affect blood flow and distribution primarily by increasing blood viscosity. The implications of the findings to conditions in hypothermia of the intact animal are discussed.

44124. BRAVI, G. Morbilità cutanea e fattori di localizzazione; la luce come stimolo di localizzazione. (Giornale Italiano di dermatologia e sifililogia, 1956. v. 97, fasc. 4, p. 293–382, illus., tables.) Text in Italian. Summary in English. Title tr.: Skin disease and localization factors; light as a localization stimulus.

An exhaustive study in three parts. Introductory section (p. 293-304) deals with the wave nature and structure of light; photons; radiation emissions of matter, etc. The following part (p. 304-327) covers photochemistry and its basic laws; photochemical molecular dissociation; photosensitivity and phototropism; fluorescence, phosphorescence, light absorption, etc. The third part (p. 327-71) deals with the photobiological aspects of various radiations; effect of radiations below 3,200Å, including u.v. (sunburn, erythema, "tanning" and their physiological and histological aspects); vital and curative aspects of this wave range; effects of solar radiation above 3,200A: solar urticaria, light allergies, effect on eyes, etc.; artificial light-sensitization. An extensive summary (p. 371-78) closes the study. As to the localization factor it is concluded that it "is individuated in the phenomenon of resonance."

44125. BREEV, K. A. Aktivnost' napadeniiâ kozhnogo, Oedemagena tarandi, L., i nosovogo, Cephenomyia trompe L., ovodov na severnogo olenfa i faktory, ee regulirufushchie. (Parazitologicheskif sbornik, 1956. v. 16, p. 155-83, illus., tables.) 21 refs. Text in Russian. Title tr.: Attacking activity of the skin and nose gadflies, Oedemagena tarandi L. and Cephenomyia trompe L, upon the reindeer and factors regulating it.

Account of investigation on seasonal fluctuations in the number of insects; development; external factors affecting their attacks on reindeer: temperature, light, relative humidity and wind, enemies of the gadflies and biological control, etc. Basic work was carried out at the Nar'yan-Mar station in Malozemel'skaya Tundra in 1947–48. Copy seen: DLC.

44126. BREGETOVA, N. G. Gamazovye kleshchi (Gamasoidea); kratkii opredelitel'. Moskva-Leningrad, Izd-vo Akad. nauk SSSR, 1956. 246 p. 562 illus. (In: Akademiâ nauk SSSR, Opred. po faune SSSR, no. 61) 190 refs. Text in Russian. Title tr.: Gamasid mites (Gamasoidea); a brief key.

Contains a systematic index to the super-family Gamasoidea and, in introductory part (p. 9-47), brief characteristics of gamasid mites; their ecological characteristics, development and biology, epidemiological and epizootic importance as transmitters of various epidemics of man and animals (table 2), and external morphology, are noted, as well as gathering of them, microscopic preparations, and methodics of laboratory rearing. In the special part (p. 48-225) are tables for the determination of 13 families, 44 genera and 127 species (males and females) of which four are new. These gamasid mites are chiefly parasites of rodents (74 out of 100 mammals) and birds (43 species). Some of the species are native to northern regions of European and Asiatic U. S. S. R. Index of mites arranged by the hosts (p. 225-31) also indices of mites' names and hosts', are appended. Copy seen: DLC.

44127. BREHM, VINCENZ, 1879—. Die Entomostraken. (Archiv für Hydrobiologie, Nov. 1955. Bd. 51, No. 2, p. 267–72, illus.) 8 refs. Text in German. *Title tr.*: The Entomostraca.

Deals with 16 species of these minute crustaceans, collected by A. Bauer in 1949 while with Expéditions polaires françaises in Greenland. They were taken from small lakes at 100-800 m. altitude in the vicinity of Eqe. Occur-

rence, sexual distribution, etc., are noted, and a local variation of Arcticocamptus cuspidatus, Schmeil is described.

44128. BREĬTFUS, LEONID L'VO-VICH, 1864–1950. Trudy Murmanskoï nauchno-promyslovoï čkspediťsii 1906 goda. Otchet nachal'nika čkspediťsii. Petrograd, Tipogr. Kirshbaum, 1915. 13, 537 p. illus. tables, maps (G. U. Z. i Z. Departament Zemledeliía) 20 refs. Text in Russian. Title tr.: The work of the Murmansk Scientific-Industrial Expedition during 1906. Report by the head of the expedition.

Contains account of research activities in continuation of those of 1905 (No. 28290). In two parts, the first presents general review of the expedition (p. 1-48): its members and crew, activities of the research steamer Andrei Pervozvannyi (oceanography, meteorology, plankton and benthos studies), the area covered (Barents Sea, southwestern Kara Sea). and itinerary; fishing experiments and fisheries research along the Murman coast by the Rybak (chiefly for salmon), visits to the natives, etc. As in 1905, A. K. Linko (p. 49-68) deals with the plankton along the western Murman coast and its relation to the fishery. Fisheries of the Murman coast in 1906, especially cod and salmon fisheries, sealing and hunting are reported (p. 69-111) by Breitfus and N. N. Prigorovskil. Meteorological studies of various air strata, including observations of kites and clouds (p. 112-25) and work on sea currents (p. 126-33) are reported by BreItfus and A. P. Smirnov. Studies of true horizon, incline of refraction, humidity, etc., are presented (p. 134-44) by Breitfus and B. I. Sreznevskil.

Part II (p. 147–537) contains lists of stations and work done on them; journals and tabular data of zoological and fisheries research, of hydrographic, hydrochemical and meteorological observations, etc. Appended are maps, hydrological and dynamic profiles, etc.

no. 12, pt. 2, p. 1805-1806.)

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30, 1956. Studies were made on roads and/or gravel fills near Glennallen, Umiat, and Barrow, 1953–1956. Disintegration is related to transient increase in amplitude of seasonal ground-temperature oscillations in the active layer and underlying permafrost following disturbance of surface. Better drainage in roadways plus temperature effect results in greater depth of thaw, melting of ice inclusions, and differential settlement. Copy seen: DGS.

44141. BRODSKIĬ, KONSTANTIN ABRAMOVICH, and M. M. NIKITIN. Hydrobiological work. Washington, D. C., 1956. 32 p. tables. (In: Somov, M. M. Observational data . . . drifting station 1950–1951, pt. 4; translated by David Kraus.) Tables of appendix 4 are paged: 422–65 from original Russian edition.

A study of the phyto- and zooplankton, and of the benthos, carried out by drifting station North-Pole-2 over an irregular course within an area extending from approx. 76° to 81°45' N. and 189°-202° E. It is the first investigation of a limited area in the Arctic Basin conducted, except for the phytoplankton, the whole year round (Apr. 2, 1950-Apr. 11, 1951), the phytoplankton being studied from April to October only. Plankton hauls were vertical: those for phytoplankton down to 100 m., those for zooplankton to the bottom. Samples were analyzed qualitatively and roughly as to quantity. In addition to the benthos, liquid silt was collected in order to determine the characteristics of sea bottom in its natural state. Results are presented in tabular form with notes on location, frequency, stage or sex, geographic distribution, ecology, etc. Appendix 1 thus lists protozoans, sponges, coelenterates and fishes; appendix 2 and 3 present the zooand phytoplankton composition according to stations; appendix 4 the results of dredgings. Copy seen: CaMAI.

44142. BRODSKIĬ, KONSTANTIN ABRAMOVICH. Zhizn' v tolshche vodý Políarnogo basseľna. (Priroda, May 1956, no. 5, p. 41–48, 6 illus.) Text in Russian. *Title tr.*: Deep-sea life in the Arctic Basin.

Based chiefly on results of observations on the drifting stations North Pole 1-4 (cf. schematic map 1). Calanid fauna of central basin is singled out as a typical deep-sea planktonic group. Its content, special characteristics, horizontal and vertical distribution and seasonal fluctuation are discussed; comparisons are made with faunas of Bering, Chukchi, and other arctic seas.

Copy seen: DLC.

44143. BRODSKIĬ, KONSTANTIN ABRAMOVICH. Zonal'noe raspredelenie (po shirotam) Calanoida v severnol chasti Tikhogo Okeana i sopredel'nykh vodakh. (Akademiña nauk SSSR. Doklady, Feb. 21, 1956. v. 106, no. 6, p. 1103–1106, 2 diagrs.) 9 refs. Text in Russian. *Title tr.:* Zonal distribution (by latitude) of Calanoida in the northern part of the Pacific Ocean and adjacent waters.

Relationship between the water temperature and calanoid species content is discussed. Richest in this respect is the tropical zone, and poorest, the arctic. Chukchi Sea fauna is a mixture of North Pacific and arctic faunas, an intermediate zone between the temperate and arctic

ones. The largest number of individual calanoids, however, is not in the tropical but in the northern section of the temperate zone (northern Bering Sea). This study is based on materials collected by expeditions of the State Hydrological Institute and Institute of Fishery and Oceanography in 1932–33, and by the "battleship" Severnyt politis 1946, and the research vessel Vitiaz', 1949–50.

Trudy 1956. t. 17, p. 18–40, illus., tables, map.) 13 refs. Text in Russian. Title tr.: Chemical investigations of the Oceanology Institute, Academy of Sciences, U. S. S. R., in the Far Eastern seas and in the contiguous areas of the Pacific.

A comprehensive review of the chemical oceanography of the area, including the Bering and Okhotsk Seas and Kuril-Kamchatka Trench region, based largely on the trips of the R/V Vitiaz' during 1949-1955. Chemistry of both the water and bottom sediments are considered. The expeditionary trips are recounted and a general outline of the turnover ("regimen") of O2, nitrites, nitrates and other N-compounds, of Si- and Pcompounds, pH, etc., is presented. The results of physical and chemical analyses of bottom deposits to a depth of 400 cm. are also described and discussed. A concluding chapter deals with the still outstanding problems of research in the area. Copy seen: DLC.

(Deutsche Akademie der Wissenschaften zu Berlin. Klasse für Mathematik und allgemeine Naturwissenschaften. handlungen, Jahrg. 1951, Nr. 3.) in German. Title tr.: New geologic research in the Urals with regard to their systematic significance.

The Urals geosyncline, which has been considered to have developed in Devonian time, is here referred back to younger Precambrian time, when weathering products from the Fennosarmatian block were being deposited in the Urals location. Relationships of the Siberian and Fennosarmatian blocks to the Urals district are discussed. A map of eastern Europe (p. 8), distinguishes the zones of depression and uplift, shield, nappes, and basins in the European zone. A Eurasian diagram (p. 17) shows the relationships of both the Fennosarmatian and Angaran blocks to the Urals-Yenisey region between them. Mineral group occurrences are generally related to tectonics and intrusions.

44178. BUDDING, ANTONIUS JACOB, 1922— . Geology and petrology of the northeastern Artfjäll. Swedish Lapland. Academisch Proefschrift, Universiteit van Amsterdam. Assen, Van Gorcum & Comp. N. V., [1951] 98 p. 31 illus., 2 maps, 3 tables (Amsterdam. Geologische Instituut. Mededeling no. 176.) 27 refs. Text in English. Summary in Dutch.

This region, approx. 65°54′-66°02′ N. and 14°46′-15°21′ E. in the headwater area of the Ume River south and west of Lake Overuman, has many peaks above 1000 m. in elevation, the highest 1444 m. The lower elevations below 540 m., at which glacial lake terraces are described, have tree and swamp vegetation. On the uplands, barren glacial drift and bedrock are conspicuous. The geologic series, petrology, and structure are treated in detail. The rocks are mainly metamorphosed sediments of the Caledonian geo-

syncline, along with volcanics dating to the major period of tectonic activity.

44179. BUDDING, ANTONIUS JACOB, 1922—, and S. J. T. KIRKLAND. The geology of the Reindeer River area. Regina, Sask., Queen's Printer, 1956. 44 p. 10 illus., fold. map. (Saskatchewan Dept. of Mineral Resources. Geology Branch. Report no. 22.) 4 refs.

The map sheet covers the area 55°30'-45' N. 103°00'-30' W. and includes part of the basins of the Reindeer and Churchill Rivers, northeast Saskatchewan. The area is one of low relief. Bedrock is all of Precambrian age and is partially covered by unconsolidated Pleistocene and Recent deposits. Oldest rocks recognized are predominantly sedimentary strata and their metamorphic equivalents. Two groups of migmatic rocks represent gradational phases between the metasediments and the younger granitic rocks which, with meta-gabbros, intrude the older sediments. Lamprophyre dikes, intruding both meta-sediments and intrusives, are the youngest rocks of the area. Folding is complex, but the general trend of both folds and faults is north-northeast. No mineral deposits of economic importance are known.

The study of frost resistivity of ceramic materials is outlined. The coefficient of frost resistivity (Kn) is defined, as a ratio of water absorbtion at room temperature to absorption after boiling under vacuum or pressure. The results of different procedures in determination of Kn are analyzed and its critical value is related to the moisture-migrating property of the material; therefore the critical value of Kn must be determined experimentally for each material under strictly specified conditions.

Discusses plans of scientific work in the coming IGY, including hydro-meteorological, gravimetric and seismic observations in the Arctic. Participation of the Soviet scientific institutions and of Soviet polar stations is stressed. A special interdepartmental committee has been set up for preparation and carrying out of the IGY program; it is headed by Academician I. P. Bardin. Folded map of U. S. S. R. includes the Soviet sector in the Arctic Basin and shows location of main Soviet polar stations, two of them in the Basin.

Conditions that effect the floodless

opening of rivers in spring are analyzed and methods of forecasting the phenomenon are discussed. Spring opening occurs before the flood in the lower stretches of the rivers and results in local influx of heat and melting of the ice cover. The speed of ice destruction depends on the weather and winter conditions. Methods of forecasting river opening which take into account only air temperatures below the freezing point in winter are inaccurate because they neglect the warming effect of groundwater run-off. Graphed data for the Tym' River in Sakhalin show the improved results obtained by considering the influence of ground water. method of analysis may also be applied for forecasting river openings in the Arctic .-From SIPRE. Arctic Bibliography. Copy seen: DLC.

Based on work of the British North Greenland Expedition during winter 1953-1954: the method was used during a 1200-km. gravity survey across the northern part of the ice sheet, and experimental results were obtained at the icecap station Northice (78°04' N. 38°29' W.). A direct relationship was found between the firn density and penetration resistance measured with the Rammsonde in the cold firn. The instrument is described. The statistical method for obtaining the relationship is briefly outlined, and various correction factors are considered. The standard error of estimate of density from resistance is less than 0.04 for all densities from 0.3-0.57 and less than 0.02 for 0.42-0.57. Corrections may be applied to allow for frictional resistance between the walls of the hole and the Rammsonde where the mean density is less than 0.47, permitting density estimates to a depth of 3 m. Density estimates at depths greater than 1 m. are inaccurate with a density greater than 0.47.—From SIPRE.

On Mar. 30, 1956, the volcano Bezymyannaya Sopka, Kamchatka Peninsula (55°57′ N. 160°32′ E.), erupted, sending ashes to 20 km. (67,000 ft.). A second eruption occurred on Apr. 1, gas and ashes rising to 10 km. On Apr. 3, a heavy haze layer over Anchorage, Alaska, was reported. Studies of upper air winds over the North American Arctic and Arctic Basin made at the British Meteorological Office indicated that a dust cloud seen over southwest England and northern Ireland on Apr. 3 originated in the Kamchatka eruption, having come directly across the Arctic Basin at average speed of about 40 m. p. h.

Various strength tests were conducted under field conditions on naturally compacted high-density snow (0.40-0.75 gm./ cc.) obtained from the upper layers of the North Greenland icecap during the 1954 and 1955 field seasons. Results are tabulated and graphed, for unconfined compression, unconfined and confined double shear, ring, flexural, and centrifugal tensile strength, torsional shear, and work of disaggregation. An empirical expression is given which relates the various strength values to the snow density. Copy seen: CaMAI.

44212. BUTKOVICH, T. R. Strength studies of sea ice. Wilmette, Ill., Oct. 1956. iv, 15 p. diagrs., tables. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. Research report 20.) 6 refs.

The studies were conducted at Hopedale, Labrador, during March 1956. Techniques and test data are given. Ring tensile strength values ranged from 3.3 to 22.3 kg./sq. cm. at temperatures between  $-2.5^{\circ}$  and  $19.1^{\circ}$  C. beam tests gave flexural strength values from 0.5-17.3 kg./sq. cm. in a similar In-place pull-up temperature range. cantilever beam tests gave flexural strength values of 2.2-4.0 kg./sq. cm. Crushing strength values ranged from 26.3 to more than 107 kg./sq. cm. in the temperature range from  $-4.9^{\circ}$  to  $-18.3^{\circ}$ Values for Young's modulus were calculated from 4520-10,225 kg./sq. cm. Copy seen: CaMAI.

**44213. BUTLER, WESLEY H.** The hydroelectric power potential of Alaska. (*In:* Alaskan Science Conference . . . 1953. Proceedings, *pub.* 1956, p. 53–63.)

On an estimate of 11,650,000 kw. of available power, less than 0.5 percent has been developed in the Territory of Alaska. Lack of transportation facilities, sedimentation problems, and ice formation are the principal factors deterring power development. Many areas are outlined which favor future development. Wood Canyon on the Copper River, is an outstanding site; several others and some of the special local problems are given.

44217. BYDIN, F. I. Zimniĭ rezhim rek i metody ego izuchenifa. Leningrad, 1933. 240 p., illus., tables, graphs, diagrs. (Leningrad. Gidrologicheskiĭ institut. Issledovanifa rek SSSR, vyp. 5.) 113 refs. Text in Russian. Summary in French. Title tr.: The winter regime of rivers and methods of its study.

A study of winter processes in rivers, summarizing the investigations made in and outside of the U.S.S.R., is pre-Winter temperatures, precipisented. tation, evaporation, moisture migration in soil and their interrelations with the river regime are analyzed and discussed, Ice conditions (including terminology) and seasonal run-off variations are treated. Special attention is given to the freezing processes and to formation of ice and sludge packs troublesome in navigation and power plants. Theoretical considerations on river capacity and rate of flow are presented in relation to hydrological and meteorological conditions with mathematical consideration of reduction of flow in winter by formation of ice and snow cover, precipitation, amount of run-off, temperature variation. Hydraulic, hydro-meteorological and other methods of determination of winter river flow at freezing and thawing are described and the solutions are simplified with a graphical method (p. 21-66). Problems of precipitation, evaporation, filtration, ground-water supply, temperature and pressure changes are separately analyzed on the basis of observed data (p. 66-89). River ice conditions are indicated by the physical properties of ice given by Barnes (No. 1076), and other data on density, thermal conductivity, heat capacity, plasticity and other constants of ice and snow obtained since 1762 both in and out of the U.S.S.R. (p. 89-96). Conditions for the formation of anchor and surface ice, islands of anchor ice (patry), naleds, and for the growth and disintegration of the ice cover before spring movement are analyzed with illus. and mathematical formulas for water flow. Thermal effects of chemical composition of the water, biochemical processes, and of warm ground water are included in this analysis (p. 96-116). A program for study of river ice conditions is presented (p. 116-23). Specific cases of ice or sludge packs (on the Neva, Svir, etc.) are presented and distribution of restricted cross sections along the river length are diagrammed (p. 124-41). Information (Russian and foreign) on river freezing, growth of anchor ice, naleds, etc. is historically reviewed 1705-1931 (p. 141-49). study is proposed and graphically presented to correlate these data with those of atmospheric temperature variation, water flow and general precipitation (p. 149-78). Deformation of the ice cover frozen to the banks is discussed with calculation of pressure due to thermal expansion of the ice. Data on freezing and opening of northern rivers are tabulated and analyzed (p. 181-93). Preparation of reports, tables, and graphs is explained in detail (p. 193-233).

44218. BYERS, FRANK MILTON, 1916-, and C. L. SAINSBURY. Tungsten deposits of the Hyder District, Alaska. Washington, D. C., U. S. Govt. Print. Off., 1956. p. 123-40. 7 maps (6 fold.), 3 tables. (U. S. Geological Survey. Bulletin 1024-F. Mineral resources of Alaska.) 3 refs.

Bedrock in the Hyder district (Portland Canal, Southeast Alaska, 56° N. 130° W.) consists of sedimentary and volcanic rocks of the Jurassic(?) Hazleton group intruded by plutonic rocks of the Coast Range batholith (Jurassic or Cretaceous). The scheelite-bearing deposits are mineralized shoots in quartz veins that cut the Texas granodiorite (oldest of the Coast Range intrusives) and inclusions of the Hazleton group within it. Other ore minerals include galena, pyrite, tetrahedrite, pyrrhotite, chalcopyrite, sphalerite, and native gold. Mines and prospects of the region are described, with suggestions for future exploration. Average grade of tungsten ore shoots on the Riverside and Mountain View properties is slightly greater than one percent WO. Copy seen: DGS.

4424. BYLUND, ERIK, 1922—. Glommersträsk by i Arvidsjaurs socken; en näringsgeografisk studie. Uppsala, Appelberg, 1947. xi, 118 p. diagrs., illus., maps, tables. (Geographica, nr. 19.) Text in Swedish. Summary in English. Title tr.: The village of Glommersträsk in Arvidsjaur commune; a study in economic geography.

Study of the most important agricultural community in Swedish Lapland (approx. 65°15′ N. 20° E.); it is 78.5 sq. km. in area, with snow cover 200-250 days a year, population (in 1945) of 658, and with electric power since 1918. The physical geography is described, and the settlement outlined from founding in Development of agriculture and subsidiary occupations, lumbering, the influence of improved communications on the economy in the 1890's, are described. Reclamation of bogs in the early twentieth century extended the arable land (from 79 to 224 hectares in 1916, to 439 h., 1946); stock raising and dairy farming became major interests. Population statistics are discussed and comparisons made between the village and the commune as a whole. Economic conditions 1928-1947 are dealt with in the final chapter in the light of earlier developments; and future prospects of the village are indicated: the dairy farms increasing, with agriculture and lumbering stable complementary industries. pasturage for cattle, possibilities for reclaiming land, and good communications are factors in economic success of the Copy seen: DLC.

44225. BYLUND, ERIC, 1922- . Koloniseringen av Pite Lappmark t.o.m. år 1867. Uppsala, Uppsala universitets geografiska institution, 1956. 448 p., illus., maps (2 in pocket), tables, diagrs. (Geographica, nr. 30.) About 330 refs. Text in Swedish. Summary in English. Title tr.: The colonization of Pite Lappmark up to and including the year 1867. This part of north Sweden (approx.

65°-67° N. 18° E.) was colonized about a century later (1750) than the areas to the north and south, where most of the early settlers were Finns who penetrated into the Swedish Lapp regions from the north and south, but not so far as Pite Lappmark. Seven successive phases of colonization are considered (cf. maps) and the changes which took place in each period are indicated. A distinction is made between Swedish and Lappish settler activity. Colonization initiatives, interruptions in the continuous habitation of a place and information on the descent or place of origin of the settlers are also shown. Most of the immigrants came from the two coastal country districts of Piteå and Skellefteå, particularly the latter, on the Gulf of Bothnia. The most important factor in the beginning of the movement into the Lappmark seems to have been social conditions in the Of decisive importance littoral regions. for the continuing colonization of Pite Lappmark has been the spread of successive generations, and local temperature has been determining influence in the pattern of settlement. Frosts were least severe high up the mountain slopes and on tongues of land in large lakes. index of place-names is appended.

44226. BYRD, RICHARD EVELYN, 1888–1957. Skyward; man's mastery of the air as shown by the brilliant flights of America's leading air explorer; his life, his thrilling adventures, his North Pole and trans-Atlantic flights, together with his plans for conquering the Antarctic by air. New York, Putnam, 1928. xv, 359 p. illus. plates, ports., maps on lining papers. Reprinted: New York, Blue Ribbon Books, 1937.

Contains an autobiographical narrative covering the author's early military career and later flying experiences, including his polar and Atlantic flights. Earlier flights over Greenland in 1925 are described as well as the preparation and operations leading up to the successful flight over the North Pole on May 9, 1926.

Popular description of Katmai National Monument. The great eruption of Mt. Katmai on June 6, 1912 is noted; geography and natural history zones (Hudsonian and Arctic) of the region are described. Its mammals (brown bear, great Alaska moose, Grant's caribou, etc.) are given as 25 species, and birds as 130. The red and silver salmon and steelhead or sea-run trout are numerous. A total of 273 species of plants, from algae to composites are recorded. This magnificent scenic-

biologic area in southwestern Alaska, now open to hunting, should be safeguarded as Katmai National Park, writer states.

44253. CANADA. DEPT. OF MINES AND TECHNICAL SURVEYS. Annual report . . . for the fiscal year 1955–56. Ottawa, Queen's Printer, 1957. 113 p. 2 fold. maps, tables.

Deals with field and laboratory work, Apr. 1, 1955–Mar. 31, 1956, of the Surveys and Mapping Branch, Geological Survey, Mines Branch, Dominion Observatories, and Geographical Branch; and includes many operations in arctic and subarctic Canada. Subjects covered are similar in scope to those of previous reports (No. 33865, 39127). Publications of the Dept. during the year are noted.

\*Copy seen: DGS.\*

44254. CANADA. DEPT. OF MINES AND TECHNICAL SURVEYS. GEO-GRAPHICAL BRANCH. Canadian maps, 1949–1954. Ottawa, Queen's Printer, 1956. 82 p. (*Its*: Bibliographical series, no. 16.)

In two parts: (1) a selected bibliography of maps published by federal and provincial governments and other agencies, arranged by region (Canada, provinces, territories) and subdivided by subject; (2) a comprehensive list of map sheets of the various federal topographic services, published or republished (revised) during 1949-1954; these are listed by map number under the various scales. tailed geologic maps, hydrographic charts and certain special subject maps of limited areas are excluded. Maps of northern Canada are included in both sections, in the first under the headings Western Canada, Manitoba, Newfoundland, Ontario North, Quebec North, Yukon and Northwest Territories.

Copy seen: DLC.

44255. CANADA. DEPT. OF MINES AND TECHNICAL SURVEYS. GEO-GRAPHICAL BRANCH. Selected bibliography of Canadian geography with imprint 1955. Ottawa, Queen's Printer, 1956. 61 p. (*Its*: Bibliographical series, no. 17.)

Seventh in this series published since 1949 (see No. 33869, 39128). References are presented by region and grouped according to subject. Arctic and subarctic material is included under Canada, Eastern Canada, Newfoundland (including Labrador), Quebec, Ontario, Western Canada, Manitoba, Northwest Territories and Yukon. Appended is list of university graduate dissertations and theses on Canadian geography 1955.

Copy seen: DGS.

44256. CANADA. DEPT. OF NORTHERN AFFAIRS AND NATIONAL RESOURCES. Annual report, fiscal year 1954–1955, 1955–1956. Ottawa, Queen's Printer, 1956, 1957. 2 v.: 115 p., 111 p. illus., fold. map, tables.

Second and third annual reports of this Department similar in scope to the first (No. 39129) and including much information on activities in the Arctic and sub-Arctic. Appendices present statistics,

and detailed reports on special projects; publications issued 1954-1956 are listed; Commissioners for Northwest Territories and Yukon report on legislation, economic activity, civil service, workmen's compensation, health, education, welfare, liquor, game conservation and fur export, municipal and local improvement districts, finances and taxation, road, bridge, and building maintenance and construction. Human problems in the Canadian North are treated in a special article in the Dept. report for 1954-1955 (p. 9-20), particularly those of the Eskimos and Indians: effects of contact with white civilization, health, economy, employment on defense projects, administration, education. Report for 1955-1956 has an account of water resources and Canada's hydrometric survey (p. 9-16) with some references to northern areas.

44257. CANADA. DEPT. OF NORTH-ERN AFFAIRS AND NATIONAL RE-SOURCES. FORESTRY BRANCH. Native trees of Canada. Fifth edition Ottawa, Queen's Printer. 1956. xvii, 293 p. illus., 172 text maps. (*Hs*: Bulletin 61.)

A publication for the layman, describing occurrence and characteristics of 172 Canadian tree species. Brief discussion of nomenclature and a checklist of the trees are given, with botanical name, English and French common names. Descriptions follow of each species, first of coniferous, then broad-leaved trees, with local English name as well as scientific and common one. Accompanying the text are range maps showing distribution of the species throughout Canada, including subarctic areas, and photographs of bark, leaves, needles, cones, fruit, flowers, etc. Alphabetical index of names is appended. Copy seen: CaMAI.

44258. CANADA. DEPT. OF NORTH-ERN AFFAIRS AND NATIONAL RE-SOURCES. WATER RESOURCES DI-VISION. Surface water supply of Canada. Arctic and western Hudson Bay drainage and Mississippi drainage in Canada; in British Columbia, Alberta, Saskatchewan, Manitoba, the Northwest Territories and western Ontario. Climatic years 1951–52 and 1952–53. Ottawa, 1956. 581 p. text map, tables. (Its: Water resources paper, no. 113.)

Includes data for the Mackenzie River at Simpson and Norman Wells, Slave River at Bell Rock (Fort Smith station abandoned), Great Slave Lake basin, Liard River basin, Great Bear Lake basin at Port Radium, Nelson and Churchill River basins. In most cases, monthly and daily discharge and monthly summaries of lake levels, inflow and outflow are given for years ended Sept. 30, 1952 and 1953. Daily gauge heights are given for some stations. For earlier data on these river basins see No. 21104 and 33873.

44259. CANADA. DEPT. OF NORTH-ERN AFFAIRS AND NATIONAL RE-SOURCES. WATER RESOURCES DI-VISION. Surface water supply Canada. St. Lawrence and southern drainage, Hudson Bay Ontario Quebec, climatic years 1951-1952 and 1952 and 1953. Ottawa, Queen's Printer, 463 p. text map, tables. Water resources paper, no. 111.) Text in English and French.

Includes data (p. 416-51) for southern Hudson Bay drainage on monthly and daily discharge of the Albany, Moose, Harricana, and Nottaway River basins for the period Oct. 1, 1951 to Sept. 30, 1953. Maximum, minimum, mean, and per-square-mile discharge in second feet, and run-off depth in inches over drainage area are given. For earlier data see No. 2759, 21106, 33879. Copy seen: DGS.

44260. CANADA. DEPT. OF TRANS-PORT. List of lights and fog signals, Newfoundland, including the coastal waters of Labrador . . . 1956. Ottawa, Queen's Printer, 1956. 82 p. tables.

Includes (p. 44-49) 39 stations along the Labrador coast 51°58′ - 56°28′ N. For each, the location is given; also color, character, and period of light or signals, height (ft.) above high water, miles seen in clear weather, the apparatus, building, flashes/min. and period of operation (year round or open navigation season) are indicated.

\*\*Copy seen: DLC.\*\*

44261. CANADA. DEPT. OF TRANS-PORT. Navigation conditions on the Hudson Bay Route from the Atlantic seaboard to the port of Churchill. Season of navigation 1955. Ottawa, Queen's Printer, 1956. 149 p. illus., 2 text maps, diagrs., tables. (Its: Annual report 27.)

Contains an historical note on the Route by N. L. Nicholson; lists of hydrographic and navigation aids in Hudson Bay and Strait; shipping reports from Resolution Island and Churchill; reports by masters of 12 cargo vessels using the

Route; ice reports from the CGS. N. B. McLean and from Resolution Island, Advance, Nottingham Hopes Island, and Churchill. An analysis of these reports is given by A. D. Hood, with ice locations charted, types of ice sketched, also weather summary, and meteorological data from seven stations in the Strait, the N. B. McLean, C. D. Howe, Edward Cornwallis, and the Hudson's Bay Co. vessel Rupertsland; dimensions and equipment of the three Government ships are included. Earlier years' reports are listed as No. 21107, 33882, 39133. Copy seen: DLC.

44262. CANADA. FISHERIES RE-SEARCH BOARD. Arctic unit Montreal, Que. (Its: Annual report, 1955, pub. 1956, p. 111-14.)

Contains general information on the need for fishery and marine biological investigation; the Calanus operations during summer 1955 (mainly walrus investigations); fisheries research in the Western Arctic and fresh waters (Great Slave Lake, Mackenzie River, etc.); phytoplankton of the Hudson Bay; biology of the white whale, walrus and ringed seal of the northern Hudson Bay.

Copy seen: DI.

44263. CANADA. FISHERIES RE-SEARCH BOARD. Eastern Arctic investigations. (*Its:* Annual report, 1954, pub. 1955. p. 107–111, table.)

Contains information on the activities of the Calanus from mid-June to mid-September 1954 (plankton and littoral collections, walrus and seal studies); temperature and salinity observations near Churchill, Feb. 1954; walrus observations, census and tagging in northern Hudson Bay; study of ringed seal material collected in 1953, largely in the Cape Dorset area; density inversions; plankton and productivity work, etc.

Copy seen: DI.

CANADA. FISHERIES RESEARCH BOARD. EASTERN ARCTIC INVES-TIGATIONS, see Grainger, E. H., and M. J. Dunbar. Station list . . . Calanus . . . 1953-54. 1956. No. 45204.

CANADA. GEOLOGICAL SURVEY, see Lang, A. H. Prospecting in Canada. 1956. No. 46239.

44264. CANADA. HYDROGRAPHIC SERVICE. Atlantic Coast tide and current tables, 1957. Ottawa, Queen's Printer, 1956. 185 p. tables. (*Its*: Tidal publication, no. 1.) Prepared by the Tidal and Current Survey under C. M. Cross.

Contains information obtained to (and through) 1955 for the St. Lawrence region and northward, including Labrador, Hudson Bay and Strait, James Bay, and the Canadian Arctic Islands. Data on time differences, tide tables, and tidal currents are similar to that in No. 33888, 39135 of Arctic Bibliography, with description of tidal currents in Hamilton Inlet, Hudson Strait and Digges Sound, and Chesterfield Inlet.

Copy seen: DLC.

44265. CANADA. HYDROGRAPHIC SERVICE. Supplement no. 1 to the 1954 edition of the Labrador and Hudson Bay pilot, corrected to November 16th, 1956. Ottawa, Queen's Printer, 1956. 20 p.

Contains additions, deletions, and substitutions to No. 39136. Includes all information affecting this pilot up to and including Notice to mariners no. 139 of 1956, particularly information on Rankin Inlet (62°45′ N. 92° W.), its approaches, and names of islands in and near the inlet.

Copy seen: DN-HO.

44266. CANADA. JOINT COMMITTEE ON OCEANOGRAPHY. Annual reports of the Oceanographic Groups for 1955–56. St. Andrews, N. B., Apr. 1956. 56, 75 p. text maps, graphs, tables. Mimcographed.

In two parts, covering work of the Atlantic and the Pacific Oceanographic Groups. Both list personnel and outline the field program during 1955 and early 1956, associated programs, and general results, noting published and manuscript reports on the work. Then follow summary accounts of the various expeditions and some of their results.

Atlantic Group activities are represented in two reports by W. B. Bailey (p. 38–42) on the origin of the deep Baffin Bay waters and the temperature and salinity of Baffin Bay-Davis Strait, Canadian Arctic Islands waters, and Beaufort Sea, based on data collected during the Labrador's cruise in summer 1954 through the Northwest Passage; six reports by N. J. Campbell (p. 43–51) on bottom topography, biological observations, current measurements, ice conditions, and temperatures in Foxe Basin and Channel, based on data collected by the Labrador in summer 1955.

The Pacific Group which has withdrawn from active research in the Western Arctic, leaving that area to the Labrador, offers four summary reports (p. 35-49) on the Hecate Project (British Columbia waters, including Dixon Entrance, Southeast Alaska): two by F. G. Barber on water masses and current observations, heat budget studies by S. Tabata, and tides by N. P. Fofonoff, based on seven oceanographic surveys, May 1954-June 1955, in the HMCS. Cedarwood, CNAV. Ehkoli, and HMCS. Jonquiere. Two reports by A. J. Dodimead (p. 50-56) deal with Project NorPac, a synoptic oceanographic survey of the North Pacific from 20° N. to Bering Sea. Twenty U. S., Canadian, and Japanese ships occupied 1200 stations during July-Sept. 1955, making temperature and salinity observations, plankton collections, geomagnetic current measurements. weather observations, and noting sea and bird life. Some results are given, and the relation of water structure to the distribution of salmon in the Gulf of Alaska is discussed. Copy seen: CaOGB.

44267. CANADA. JOINT COMMITTEE ON OCEANOGRAPHY. Minutes of a meeting to discuss standardization of sea ice terminology in North America, required by the chairman, Canadian Joint Committee on Oceanography. Ottawa, 1956. 3 p. Mimeographed.

Records meeting, Nov. 14, 1956, of U. S. and Canadian government representatives, and one from the Scott Polar Research Institute, Cambridge, Eng. A Canadian glossary of sea ice terminology (prepared by I. M. Dunbar) was presented: the forthcoming World Meteorological Organization Ice Nomenclature was discussed; the latter and its ice code (when completed in 1957) are to be basic for North America. Canadian iceobserving program, U. S. plans for an international symposium on sea ice (fall 1957), and sea ice research by the Canadian Defence Research Board are also noted. Copy seen: DN-HO.

44268. CANADA. JOINT COMMITTEE ON OCEANOGRAPHY. Review of Canadian oceanographic studies in the North Pacific Ocean, 1955–56. Nanaimo, B. C., Pacific Oceanographic Group, Oct. 1956. 29 p. 9 text charts, graphs.

Includes preliminary results of Project NORPAC, a U.S.-Canadian-Japanese oceanographic investigation in the North Pacific and Bering Sea, in which Canada surveyed the area 47°-55° N. and west to long. 180° in Aug. 1955; in Aug. 1956 an

extensive survey of the Gulf of Alaska and adjacent waters was carried out. Summarized results are presented (with charts) for summer temperature distribution and structure, surface salinity and salinity structure, dissolved oxygen concentration, circulation. These data are related to salmon distribution.

44269. CANADA. JOINT COMMITTEE ON OCEANOGRAPHY. PACIFIC OCEANOGRAPHIC GROUP. Physical and chemical data record, Dixon Entrance, Hecate Strait, Queen Charlotte Sound, 1934, 1937, 1938, 1951. Nanaimo, B. C., Apr. 1956. 56 p. 4 text charts, tables. (*Its:* Report no. 27.) 9 refs.

Contains data collected by personnel of the University of Washington in Dixon Entrance (Southeast Alaska; 54°28' N. 131°51′ W.), Sept. 1934 and July 1937 in the MV. Catalyst (23 stations) and by the Canadian Pacific Oceanographic Group and Fisheries Research Board in Dixon Entrance and British Columbia waters, May-June 1938 in the MV. Amlac (61 stations), May, July-Aug. 1951 in the HMCS. Cedarwood (67 stations). each station the following information is given: lat. and long., date and time, depth to bottom, weather conditions, depth of sample, sea temperature, salinity, dissolved oxygen content, density. Personnel taking part in the surveys are listed. Copy seen: DN-HO.

44270. CANADA. JOINT COMMITTEE ON OCEANOGRAPHY. PACIFIC OCEANOGRAPHIC GROUP. Physical, chemical and plankton data record, Project NORPAC, July 26 to September 1, 1955. Nanaimo, B. C., Feb. 1956. 202 p. illus., 3 text charts, diagr., graphs, tables. (Its: Report no. 26.) 10 refs.

Contains results of Canadian investigations during joint U. S.-Canadian-Japanese synoptic oceanographic survey of the North Pacific. Area covered by Canada (47°-55° N. and west to 176° W.) included southern Gulf of Aleutian waters where the oceanographic vessel HMCS. Ste. Therese occupied 85 stations. Observed physical and chemical data at 17 levels (0-1200 m.) are presented (p. 7-100) for each of these stations: depth of sample, temperature, salinity, dissolved oxygen and phosphate, bathythermograms; also station position, date, weather and sea conditions. Interpolated physical and chemical data at standard depths (0–1000 m.) are given (p. 101–146) for the 85 stations. Fishes, sea mammals, and birds seen are listed, and plankton data (0–400 m.) are given for each station (p. 147–70). Bathythermograms and meteorological observations (Aug. 1–Oct. 31) from Ocean Weather Station PAPA (50° N. 145° W.) conclude the report. Copy seen: DN–HO.

44271. CANADA. METEOROLOGI-CAL SERVICE. Climatological summary, Alert, N. W. T., Canada, June 1950— December 1953. Toronto, 1955. 71 p. text map, diagr., graphs, tables.

A compilation of surface and upper air data, with description of the site of this weather station on the northeast Ellesmere coast (82°30′ N. 62°20′ W.), its supply by sea and air, weather observation program, and instruments used. Tables contain summarized surface data for June 1951–Dec. 1953, based on sixhourly observations; daily surface data for each month, May 1950–Dec. 1953, and synoptic observations June 1950–Dec. 1953; summarized upper air data for each 1950–Dec. 1953, based on twice daily observations. Copy seen: DWB.

44272. CANADA. METEOROLOGI-CAL SERVICE. International index numbers and two-letter identifiers for meteorological stations in Canada. Effective June 1st, 1956. Toronto, Apr. 1956. 24 p. Mimeographed. (Its: Circular 2772, NUM-334.)

Lists all meteorological stations (approx. 260) from which synoptic, hourly, pilot balloon and/or rawin reports or radiosonde reports are received. Arctic and subarctic stations are included. For each is given: number, two-letter identifier, latitude and longitude, elevation, classification (type of report). Changes will be issued monthly in the form of Index number changes.

Copy seen: DWB.

44273. CANADA. METEOROLOGI-CAL SERVICE. Snow cover data: Eastern Canada, winter 1954/55. Toronto, 1956- in progress. 16 p., 3 tables.

First of a projected series on accumulation of snow on the ground in Ontario, Quebec, and Maritime provinces including Labrador. Summary tabular data show snow depth, Oct.—Apr.; depth and crust conditions, Oct.—Apr., Ontario only; also snow depth and water equivalent in inches for the various snow

courses within river basins of each province. Stations' elevation, latitude and longitude are given. For six in the northern Quebec-Hudson Bay-Hudson Strait region and five in Labrador, snow depth data are given.

Copy seen: DWB.

44274. CANADA. METEOROLOGI-CAL SERVICE. Two-letter identifiers for locations in Canada. Fourth edition, effective May 1st, 1956. Toronto, 1956. 20 p. Mimeographed. (*Its*: Circular 2767, NUM-332.)

"Two-letter identifiers are established to meet the requirements of weather services and communications and air traffic control services to the extent that the requirements have a direct bearing on air navigation." The identifiers are assigned to commercial airfields, land and water aerodromes, weather observing stations, radio range stations, aeronautical radio beacon stations, airway reporting points, and are used for all domestic purposes. These stations (approx. 450), including those in arctic and subarctic areas, are listed alphabetically by letter identifiers. Changes will be issued monthly in the form of Bulletins. Copy seen: DWB.

44275. CANADIAN ARMY JOUR-NAL. Winter training at Churchill. (Canadian Army journal, Apr. 1956. v. 10, no. 2, p. 40–47, illus.)

The training and testing program conducted during the 1955-56 winter at Fort Churchill, northern Manitoba, is described briefly, and several illustrations from training maneuvers are presented. Tests included clothing and new infantry weapons as well as cold weather tests of the NIKE, the land-to-air guided missile developed by the U. S. Army.

Copy seen: DLC.

**44276.** CANADIAN AVIATION. Skiwheel combination. (Canadian aviation, Feb. 1950. v. 23, no. 2, p. 40, illus.)

A commercially developed light-airplane ski which can be attached to existing landing gears to form a ski-wheel combination is described and illustrated. The ski may be placed in a fixed position approximately one inch above the rolling radius of the tire, or fitted for up-anddown hydraulic or electrical actuation. The practicability and efficiency of this combination has been proven on military aircraft operating in the Arctic.

CANADIAN GOOD ROADS ASSOCIATION, see Mathieu, O. Current practice in snow and ice control . . . 1956. No. 46657.

44277. CANADIAN MINING JOUR-NAL. Laporte skimobile. (Canadian mining journal, Aug. 1956. v. 77, no. 8, p. 92, illus.)

Vehicle, manufactured by Canadian Skimobile Mfg. Co. Ltd., can be adapted to summer use by replacing front skis by caterpillar tracks; it can be used in swampy muskeg and mountainous terrain as well as all types of snow and ice conditions. It carries four passengers with luggage, or work load of 1000 lbs. Speed is 20 m. p. h. when breaking road, to 50 m. p. h. on hard-packed snow, with equalizer suspension, caterpillar track sinks sufficiently under various snow depths and conditions to permit adequate traction, while rear skis rise automatically to suspend the main frame and load at surface. Copy seen: DGS.

44278. CANADIAN MINING JOUR-NAL. Windproof clothing. (Canadian mining journal, Aug. 1956. v. 77, no. 8, p. 91, illus.)

Ensolite, an effective insulating material was developed by Dominion Rubber Co. Ltd. and tested by the armed forces. It is plastic and sponge-like, composed of millions of tiny spherical nitrogen gas-filled cells. Unicellular structure accounts for its low water absorption properties and low thermal conductivity. Ensolite provides maximum protection against cold and wet as a lining for jackets, trousers, vests, boots, shoes, snow suits, etc.

Copy seen: DGS.

44279. CANADIAN WEEKLY BUL-LETIN. [News notes.] (Canadian weekly bulletin, 1956. v. 11, no. 9-60.)

Current news releases on:

Polar stations: Re-supply of U. S.-Canadian weather stations in the Arctic Islands (Operation NORS-56); success of ice-breaker d'Iberville in reaching Eureka, blocked by ice in 1955 (no. 34, p. 3; no. 40, p. 3-4; no. 44, p. 5); new weather observing and rawinsonde station established at Sachs Harbour, southwest Banks Island, Nov. 1955 (no. 18, p. 4); two modern prefabricated buildings erected at the Permafrost Research Station,

Norman Wells, Mackenzie District (no. 51, no. 4);

International Geophysical Year: Canada's program outlined, with polar stations noted (no. 9, p. 4); surface and upper air weather reports to be made during 1957-1958 (no. 45, p. 4); launching site for rockets will be ready at Fort Churchill, Manitoba, in Oct. 1956; rocket investigations noted (no. 47, p. 6);

Radar lines: excerpts from addresses by R. Campney, Canadian Minister of National Defence, describing planning and building the Mid-Canada Line, a trip to inspect this and the DEW Line, Canadian sovereignty in DEW Line area (no. 25, p. 1-2; no. 53, p. 1-2, 5-6); weather forecasts by Canadian Meteorological Service to assist aircraft flying supplies and personnel to DEW Line (no. 34, p. 4); use of six helicopters based at Knob Lake in airlift to supply Mid-Canada Line in Labrador area (no. 48, p. 4); completion of five months roundthe-clock supply operation for Mid-Canada Line in Hudson-James Bay area, Nov. 1956, during which 40 landing craft transported 35,000 tons of supplies, with loss of only 10 tons (no. 56, p. 6);

ł

V

e

-

,

Wildlife and fisheries: To protect nesting grounds of whooping cranes, Canadian Dept. of Transport Apr. 1, 1956 orders pilots not to fly below 2,000 ft. over a certain area of Wood Buffalo Park nor to land (no. 18, p. 4); Great Slave Lake fisheries production in Dec. 1955 (576,437 lbs.) almost doubled that of Dec. 1954 because of early cold season (no. 16, p. 4);

Surveys and expeditions: Survey and mapping program of Canadian Dept. of Mines and Technical Surveys includes eight field parties in Northwest Territories and Yukon, hydrographic surveys in arctic waters, extension of shoran network over Arctic Islands, radar altimeter surveys in the north (no. 34, p. 4); exploratory soil survey made of the Slave River lowlands (3,180,000 acres) in Mackenzie District indicated soils arable for crops suited to climate (no. 37, p. 3); studies in marine resources and biology by E. H. Grainger and H. Andersen frozen in at Igloolik, winter 1955-56 in the fishery research vessel Calanus (no. 11, p. 4); third annual voyage of ice-breaker Labrador to Canadian Arctic waters, where she assisted in supply of DEW Line sites, carried out surveys in Hudson Strait and Foxe Basin, made east-west passage of Fury and Hecla Strait first ship (to do so); her microwave position fixing system is noted (no. 36, p. 3; no. 48, p. 2; no. 49, p. 3);

Military tests: Test of army signals equipment carried on by 31-man team during Jan.-Mar. 1956 in the Churchill region (no. 12, p. 4); tests of standard cars (not modified for arctic conditions) by Capt. H. W. House showed that cars kept in first-class condition with batteries fully charged will start in coldest weather at Churchill (no. 15, p. 4); various types of Canadian and British military vehicles (no tracked vehicles) will be tested at Fort Churchill from Nov. 15, 1956-Mar. 31, 1957, for cold starting and reliability, engine-heating equipment, snow manoeuverability (no. 55, p. 4); successful tests on magnesium snowshoes which are light weight, corrosion-, rot- and moistureproof; they have been recommended for army adoption (no. 15, p. 3; no. 56, p. 3);

Eskimos, Indians: Eskimos and Indians, about one percent of Canadian population, account for one-eighth of all admissions to TB hospitals, young people under 20 most heavily affected; pilot study on rehabilitation of tuberculous Indians being conducted at Charles Camsell Indian Hospital, Edmonton (no. 30, p. 3; no. 42, p. 3); excerpts from address by J. W. Pickersgill, Superintendent of Indian Affairs on future of the Canadian Indian, his status, job opportunities, etc. (no. 36, p. 1-2, 6);

Alaska Highway: Life in the Canadian maintenance camps described (no. 26, p. 3); construction of steel and concrete bridge over Slims River, Yukon, was started in Oct. 1955 (no. 22, p. 4); bridge over arm of Nisutlin Bay at Milepost 803.4 was officially opened May 1956, after two years of construction (no. 29, p. 4); ambulance service provided by Canadian Army between Dawson Creek, British Columbia and the Alaska-Yukon border with two ambulances stationed in Whitehorse and nine at maintenance camps along the highway (no. 22, p. 3);

Northwest Territories and Yukon development: Excerpts from speech by R. G. Robertson, NWT Commissioner, at Jan. 1956 Session of NWT. Council, stressing transport problems, economic condition of native peoples, need for railroad to Great Slave Lake, new Aklavik site, growth of Frobisher Bay (no. 12, p. 1-2); economic conditions discussed by Robertson at NWT. Council Session at new Aklavik site, Sept. 1956, stressing need for expansion in lumber industry, commercial fisheries and mining (no. 44, p.

4-5); description of new coats of arms granted to NWT. and Yukon (no. 23, p. 5); total Yukon hydro-electric power capacity now 2,190 hp. with new 800 hp. plant on McIntyre Creek near White-

horse (no. 10, p. 5);

Miscellaneous: Construction work underway in the Canadian North by Canadian Dept. of Public Works in 1956 amounts to almost \$10 million. Some of the 95 projects include roads and bridges, houses for federal employees, public buildings, wharfs, dredging (no. 43, p. 1-2); Governor-General Massey's 10,000 mile tour of northern Canada and flight over North Pole in late Mar.—Apr. 1956 (no. 20, p. 5; no. 21, p. 2); Hudson Bay Route general cargo imports up more than 50 percent over those of 1955, with total imports amounting to 2,314 tons in 1956 shipping season (no. 60, p. 2).

Account of observations on ten dogs made hypothermic to about 24° C. The most pronounced changes were those of rate (decrease of 400 percent) and duration of ventricular systole (increase of 300–400 percent). Conduction time, delay between Q and first sound and duration of each heart sound showed far less marked increases. Copy seen: DLC.

44283. CARLES, LOUIS MARCEL, 1903—. Note pour contribuer à l'étude médicale du climat polaire. (Presse médicale, année 61, Feb. 1953, no. 8, p. 160–61.) Text in French. Title tr.: Contributive note to a medical study of polar climate.

Notes based on two years' sojourn in Greenland (1949-51), regarding physical and mental resistance to the environment especially to cold and darkness, increasing the resistance to these factors, personal differences in resistance, frost-

bite, respiratory disorders, etc.

Copy seen: DNLM.

44284. CARLGREN, OSKAR HEN-RIK, 1865- . Some west American sea anemones. (Washington Academy of Sciences. Journal, Jan. 15, 1936. v. 26, no. 1, p. 16-23, 5 illus.) 8 refs.

Contains descriptions of six species, three new, and one variety. Metridium senile var. fimbriatum from Sitka is included. Copy seen: DLC.

44285. CARLSON, CLARENCE J. Quality changes in frozen dungeness crab. (*In:* Alaskan Science Conference . . . 1953. Proceedings, *pub.* 1956, p. 76–77.)

Contains a number of suggestions to increase the quality of preserved meat of this crab, including: vacuum packing, and storing at  $-20^{\circ}$  C., flooding with brine preliminary to this process and, exclusion of air.

Copy seen: DGS.

44286. CARLSON, LOREN DANIEL, 1915-, and D. C. PEARL. Effects of temperature and work on metabolism and heat loss in man. (Society for Experimental Biology and Medicine. Proceedings, Feb. 1956. v. 91, no. 2, p. 240-44, illus., tables.) 11 refs.

Account of temperature, heat loss and 0<sub>2</sub>-consumption in men exercising at temperatures of 20° to 10° C. Exercise after cooling was accomplished at a greater energy cost than during cooling. Overall

direct heat loss was less during exercise after cooling. Copy seen: DLC.

44287. CARLSON, WILLIAM SAM-UEL, 1905- . Movement of some Greenland glaciers. (Geological Society of America. Bulletin, Feb. 1939. v. 50, no. 2, p. 239-55, 4 text maps, 2 graphs, 3 tables.) 13 refs.

Contains results of studies made by the author during the Michigan University Greenland Expedition in winter 1930-1931 in the Upernavik Distrikt (72°-74° N. 54°57' W.) on the west coast. The front of Upernaviks Isstrøm, largest and most productive outlet glacier of the region, was mapped in its entirety; studies were made of its rate of movement and compared with those by C. H. Ryder in 1886 and 1887 (No. 15067). Ussings, and Cornell Glaciers and their activity are described briefly. Some glaciers in the district showed a marked retreat within the period 1890-1930, greatest at Upernaviks Isstrøm in the south.

44288. CARLSSON, KJELL. Axel Hamberg, pionjär i Sarek. (På skidor; Föreningen för skidlöpningens och friluftslivets främjande i Sverige. Årsbok 1953, p. 125–35, illus.) Text in Swedish. *Title tr.:* Axel Hamberg, pioneer in the Sarek.

Notes on his work in these mountains (approx. 67°27′ N. 17°40′ E.) of north Sweden during the period 1895–1930, with extracts from his diaries. Hamberg, 1863–1933, professor of geography at Upsala University, carried out important geological, meteorological, cartographic, ethnological and, especially, glaciological work. The emphasis here is on practical experiences, nature, cooperation with

Lapps, etc.; scientific results are listed as No. 45405. Copy seen: SPRI.

44289. CARNEGIE CORPORATION OF NEW YORK. The white frontier. (*Its*: Quarterly report, July 1956. v. 4, no. 3, p. 1–3, illus.)

A general account of various research fields and programs in the Canadian Arctic and sub-Arctic with comments on the joint program of McGill University and the Arctic Institute of North America. Carnegie funds provide for graduate scholarships in arctic research.

Copy seen: DLC.

44290. CARPENTER, EDMUND SNOW, 1918— North to an enchanted isle. (Varsity graduate, Oct. 1956. v. 4, no. 4, p. 166–67, 189–90, port., sketch map.)

Popular account of author's travels in spring-summer 1955 from Churchill to Melville Peninsula, to Igloolik by dog sledge with an Eskimo family, five weeks at the Eskimo camp of Kieertakjuk, then to Jens Munk and Kaersuk Islands off the coast of Baffin, and up Jorgensen Fjord, northern Baffin. Some comments are made on the Eskimo customs, and viewpoint as revealed in language.

44291. CARPENTIER, A. Le Groenland: flore actuelle, flores fossiles. (Revue des questions scientifiques, Brussels, 1948. Année 61, t. 119 (5e série, t. 9), p. 77–88.) 12 refs. Text in French. Title tr.: Greenland: present flora, fossil flora.

Cretaceous and Tertiary plant life in Greenland offers a marked contrast to present vegetation. This area was characterized by trees which are found today only in lower latitudes and which need much milder conditions for growth than exist in Greenland at present. The various hypotheses accounting for great climatic changes are briefly reviewed.

Copy seen: DGS.

44292. CARR, J. M. Zoned plagioclases in layered gabbros of the Skaergaard intrusion, East Greenland. (Mineralogical magazine, June 1954. v. 30, no. 225, p. 367-75, illus., graphs, table.) 10 refs.

Contains results of optical work on three analyzed feldspars of gabbros belonging to the main layered series of the Skaergaard intrusion, East Greenland (68°09' N. 31°45' W.). "The work was begun with the intention of providing precise optical data to be used in further defining the relationship between composition and optics. The primary precipitate feldspar crystals, hitherto thought to be devoid of zoning, were found, however, to possess a zoning which prevents the data being used in this way." This zoning and its probable origin are discussed in some detail. Notes on methods of measuring the zoning, and techniques adopted for each method, are appended.

44297. CASWELL, JOHN EDWARDS, 1913- . Arctic frontiers; United States explorations in the far North. Norman, University of Oklahoma Press, 1956. xv, 232 p. ports., illus., maps.

This book for general readers results from the writer's research reported as No. 2930 and 21139 of Arctic Bibliography. United States Government effort in arctic area during that epoch between the loss of Franklin and the attainment of the North Pole is delineated in a chronicle of the expeditions which it sponsored or supported: De Haven's of 1850-51, Kane's 1853-55, Hayes 1860-61, Hall 1860-62 and 1864-69, De Long in the Jeannette 1879-81, Schwatka 1878-80, Greely and Ray in the first International Polar Year. Peary's work is discussed. Cook's claims are appraised. Five expeditions based on Spitsbergen or Franz Josef Land (Wellman and Ziegler) are recounted, and a useful outline is added of government exploration in Alaska, primarily north of the Brooks Range.

In a concluding chapter, an essential continuity of American effort is indicated

for this period; the geographic accomplishment, and contribution to physical and other sciences are characterized. Maps showing the routes of the expeditions and photographs of many of the leaders are also given. Copy seen: DLC.

44305. CHAMBERS, JACK V., and P. C. DALRYMPLE. Color regions of the world. Natick, Mass., Nov. 1956. iv, 56 p. tables. (U. S. Quartermaster Corps. Environmental Protection Research Division. Technical report EP-37.) 15 refs.

Contains a generalized world-wide summary of the natural landscape colors occurring in each month designed to accompany the World color regions atlas, required for a successful camouflage program. An analysis is made of the maps in the atlas, summarizing in tabular and textual form the information contained, and explaining the basis on which the colors and regions were determined. White areas are those totally under snow, white sand, or salt flats; and partly white areas, those with a seasonal snow cover. Together, these areas average 18 percent of the world land area. In Jan., 17.5 million sq. mi. of land in the Northern Hemisphere is white; by July and Aug., only one million sq. mi. of snow cover exists, and nearly all of this in Greenland. An analysis of background color types for areas with seasonal snow cover is also given. Copy seen: CaMAI.

**44306.** CHAMPION, A. Øksfjord Peninsula. (Alpine journal, May 1956. v. 61, no. 292, p. 204–205, fold. map.)

Contains description of mountaineering during Aug.-Sept. 1955 by a British party of five, including the author. Mountains of this peninsula west of Øksfjord (70°12′ N. 22°18′ E.) range from 2,500 to 4,000 ft. and are dominated by three icecaps. Several first ascents were made, also observations of Øksfjordjökelen and its north-flowing glaciers. Copy seen: DLC.

1

Posthumously published. A study of the technical and economic conditions of hydro-electric development projects to be completed by 1965, also of a projected system of interconnecting river basins to unify Soviet water resources for a major economic expansion. Special attention is given to the direct and indirect utilization of the water resources of the northern regions: the Severnaya Dvina, Pechora, Usa, Ob', Irtysh, Yenisey, and their tributaries. Direct utilization, for example, involves raising the level of the Ob' locally by dam construction and redirecting part of the water masses into the Volga, or, similarly, redirecting from the Yenisey into the upper Ob'. This redirection can be done through a system of specially built channels and interconnecting streams, with or without the aid of pumping stations. The technical and economic aspects of pumping are ana-Natural conditions and technical methods for the inter-basin connections are described in detail for different river systems, including the Ob' and Yenisey (p. 72-113); and an economic evaluation of these projects is added (p. 114-34). Indirect utilization of water power involves construction of local hydro-electric plants and transmission of electric energy by wire to industrial centers in the Ural, Kuznetsk, or other regions. Seasonal variations in flow and temperature are given for different river basins of the North. Appendices show (1) present and proposed installations and inter-connecting systems (fold. map), and fold. longitudinal profiles of water levels of various river basins. An introductory sketch of the late author is contributed by B. I. Nikitin. Copy seen: DLC.

44311. CHAPMAN, ROBERT MILLS, 1918—, and others. Geological and geographical research in Alaska's future development, a round table discussion. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 176–78.) Other authors: A. H. Mick, R. C. Ragle, K. H. Stone, and C. W. Wilson.

Objects of the discussion were an enumeration of research topics for young scientists and "self-appraisal to help the more mature analysts understand better the goals, relations, and significance of their work." Twenty-five major needs for increased geological and geographical research are listed. *Copy seen:* DGS.

44312. CHAPMAN, SYDNEY, 1888—. The IGY auroral programme. (CSAGI

Arctic Conference . . . pub. in: I. U. G. G. news letter, Sept. 1956. 5° année, no. 15, p. 380–84.)

The long-term objectives of the program are noted, and the immediate objectives are outlined as obtaining a synoptic picture by photographic or visual methods, warning services, radio and radar detection, and rocket studies,

etc.

44313. CHAPMAN, SYDNEY, 1888—. The International Geophysical Year, 1957–1958. (Polar record, Jan. 1956. v. 8, no. 52, p. 33–35.)

44321. CHEKOTILLO, ANDREĬ MAR-KOVICH, 1886— . Merzlotovedenie za rubezhom k 1955 godu; literaturnyī obzor. (In: Akademiíā nauk SSSR. Institut merzlotovedeniíā. Materialy k osnovam ucheniíā o merzlykh zonakh zemnoī kory, 1956. vyp. 3, p. 186–229, table, illus., map.) 257 refs. Text in Russian. Title tr.: Permafrostology abroad to 1955; a review of the literature.

Review article, based on studies of reports published outside the U.S.S.R.; such studies were started in the Institute of Permafrostology before World War II and continued systematically since 1945. The United States and U. S. S. R. are noted as countries where permafrostology and the solution of engineering problems associated with frozen ground have reached wide development. Considerable attention is given to reports on construction work in the Arctic: highways, railroads, airfields, buildings, dwellings, etc. The foundations of the Thule Air Base (Greenland) and the reinforced concrete protection of underground piping are described with illus. (p. 202-205). leading role in permafrost research is noted for the U.S. Army Corps of Engineers and for its well-equipped research A large network establishment. institutions, among them the U.S. Highways Research Board, University of Minnesota, Purdue University, Canadian National Research Council, are mentioned as well as individual scientists, in connection with specific problems. Permafrost terminology is analyzed and 31 specific terms are given (p. 214-15) in English with Russian equivalents. Appended is a list of the examined reports, etc., predominantly American. Permafrost distribution in the Northern Hemisphere is mapped (p. 189). Copy seen: DLC.

44322. CHEKOTILLO, ANDREÍ MAR-KOVICH, 1886— . Promerzanie pochvy v kholodnye i teplye zimy. (In: Voprosy geologii Azii, t. 2, 1955. p. 543-64, tables, graphs.) 4 refs. Text in Russian. Title tr.: Soil freezing in cold and warm winters.

"Variations in the depth of soil freezing in European Russia are examined for the period 1893-1952, and the effects of snow cover and general winter conditions on air temperature and depth of frost penetration are discussed. The most effective snow cover was observed in the northern, northeastern, and central regions where the continuous snow cover was frequently deep. Moderate soil freezing and very low air temperatures were characteristics of an early, deep snow cover. Moderate air temperatures were usually observed when the cover was either thin or deep but late in forming. Deepest soil freezing in cold winters occurred in southern areas where the snow cover was usually intermittent."—SIPRE. Copy seen: DLC.

44325. CHENTSOV, R. A. Izuchenie fiziki nizkikh temperatur. (Akademia nauk SSSR. Vestnik, Oct. 1956. god 26, no. 10, p. 99–102.) Text in Russian. Title tr.: Study of physics of low temperatures.

Reviews problems discussed in the papers presented at the Second All-Union Conference in Leningrad during June 24–28, 1956. Theory of Fermi liquid is applied by Academician L. D. Landau in the study of normal and isotopic liquid helium (He3 He4) as an example of the quantum liquids, remaining liquid at temperature of absolute zero. The results of further theoretical studies on liquid helium and low temperature effects were reported by other investigators: "zero sound", variations in magnetic susceptibility, theory of ultra-electric conduction, effect of magnetic field on resistance of metals at super low temperatures, magnetic resonance, etc. Academician P. L. Kapitsa who participated in the discussion of many of the papers, predicted in his final remarks that the physics of low temperatures will become widely adopted in studies of the electric, mechanical, optical and other properties of substances.

CHERNOV, ALEKSANDR ALEKSAN-PROVICH, 1877–, see Pervukhina, A. E. Solıânye istochniki . . . 1940. No. 47311.

44331. CHERNOV, G. A. Arkheologicheskie nakhodki v tsentral'nof chasti Bol'shezemel'skof tundry. (Akademiñ nauk SSR. Komissiñ po izucheniñ chetvertichnogo perioda. Trudy, 1948. t. 7, vyp. 1, p. 55–122, illus. maps, tables.) 36 refs. Text in Russian. Title tr.: Archeological finds in the central part of the Bol'shezemel'skaya Tundra.

Describes 28 archeological sites explored by the author in the summer of 1939 during a geological survey conducted by the Northern geological administration in the Kolva River basin, right A concise geotributary to the Usa. morphic and geological account of the region (approx. 67° N. 59° E.) is in-A detailed inventory and description of the flints, potsherds (with drawings and photos), bronze, brass and iron artifacts is given, and the lack of bone implements noted. No agricultural tools were discovered; a hunting and fishing economy is suggested by the flint The small size of the flints is ascribed not to a microlithic culture level but to the absence of large flint-bearing deposits and the resulting use of brittle flint nuclei, washed up by the rivers, for the manufacture of implements. The striking similarity of the Kolva River flint and pottery finds to those made in the White Sea coastal region (cf. No. 32126) is stressed, and a dating from late stone age (for sites lacking potsherd remains) to late bronze age (for those containing advanced forms of hole-comb pottery) is suggested. The iron and brass finds seem accidental and do not belong to the original river and lake settlements. Author's earlier report on these sites was listed as No. 28516. Copy seen: DLC.

4432. CHERNOV, G. A. Novye arkheologicheskie nakhodki v Pechorskom basselne. (Akademiß nauk SSSR. Institut istorii material'noï kul'tury. Kratkie soobshcheniß, 1956. vyp. 64, p. 104–115, illus., maps.) 23 refs. Text in Russian. *Title tr.:* New archeological finds in the Pechora basin.

Previous excavations in the Bol'shezemel'skaya Tundra region are noted and account is given of the author's flint and potsherd finds in stone age settlements along the lower Pechora (2), Laya (3), Kozhva (1), and Ukhta (2) Rivers. Prevailing theory, that Bol'shezemel'skaya Tundra was peopled from the east (Ural and lower Ob') is challenged. A south-north migration across narrow river divides is suggested: a close resemblance is seen between flint flaking and ceramic techniques in Bol'shezemel'skaya Tundra and archeological finds along the Kama and Vishera Rivers, south of the Pechora Basin.

The interchange and concentration of CaCO<sub>3</sub> in different water layers are described. The upper and deep water layers of the Arctic Basin are rich in CaCO<sub>3</sub>, though not saturated. The excess accumulated in the Basin is carried away partly by currents, particularly in ice floes, with the ice having a relative content as great as 1,000 times that of the water.

44348. CHISTIAKOV, F. M., and Z. Z. BOCHAROVA. Vlifanie nizkikh temperatur na razvitie mikroorganizmov, 4; vlifanie nizkikh temperatur na razvitie plesnevykh gribkov. (Mikrobiologifa, 1938. t. 7, vyp. 7, p. 838–42, tables.) Text in Russian. Summary in English. Title tr.: Influence of low temperatures upon the development of microorganisms,

4; influence of low temperatures upon the

development of molds.

Account of investigation with about a dozen molds reared at temperatures of  $+20^{\circ}$  to  $-18^{\circ}$  C. on several types of substrates. The rate of growth was found to depend on temperature and on the nature of the culture medium, the various species behaving differently towards both of them; in one species considerable differences appeared under similar conditions of temperature and substrate. There was no growth below  $-8^{\circ}$  C. Copy seen: DLC.

44349. CHITTLEBOROUGH, R. G. Southern right whale in Australian waters. (Journal of mammalogy, Aug. 1956. v. 37, no. 3, p. 456-57.)

Contains information on the early abundance and economic role of this whale in south Australian and New Zealand waters; excessive whaling and decline beginning around the mid-19th century; protection measures; complete absence of the whale from the area during the past 50 years. A cow and calf were sighted in the area in Aug. 1955; observations regarding size, behavior, intervals between blows, etc., are given.

44352. CHRISTENSEN, ERWIN OTTO-MAR, 1890 . Primitive art. New York, Crowell, 1955. 384 p., illus. (part col.), maps. (A Studio publication.)

Includes as chap. 2 (p. 60–104, map, 42 illus., 41 refs.) Alaska and the Pacific Northwest Coast, popular sketch of the Eskimo and Indian groups, their religious beliefs and art forms with 42 illus., mainly photographs of wood and stone carvings in major American and Canadian museums: totems, masks, utensils, etc. Scandinavian paleolithic sites are outlined (p. 331, 3 illus.). Copy seen: DLC.

44353. CHRISTENSEN, HELGE. Eenmands-ekspeditionen i Upernavik nord-distrikt. (Grønland, May 1956, nr. 5, p. 185–88, port.) Text in Danish. *Title tr.:* A one-man expedition to the northern Upernavik district.

Interviews Hans Lynge on his expedition in 1952–53 to study the language and traditions and legends in this region of northwest Greenland, 72°-74° N. 54°57′ W. (cf. No. 41166). He also made sociological studies among the 25 pure Eskimo families in the Upernavik district.

Copy seen: DLC.

44354. CHRISTENSEN, HELGE. Fra det nye Thule. (Grønland, Aug. 1956, nr. 8, p. 289–94, illus.) Text in Danish. *Title tr.:* From the new Thule.

Account of the settlement formerly called Kanaq (77°27' N. 69°11' W., north Greenland) but renamed in 1953 when the native population moved there from Thule Air Base, now officially termed Dundas. The new Thule with half the population of the District (200) is a modern community with hospital, boarding-school, power station, waterworks, radio telephone station, shop, church, etc.; but the people were trained for and live by hunting and fishing.

Home-grown potatoes will not supply Greenland's needs, due to the short harvesting time, transport problems and lack of frost-free storage. Annually, 2,000 tons would be required for potatoes to figure in daily diet of the entire population. At present the yearly consumption is about 500 tons, mainly by Danes or Greenlanders with Danish habits. Large-scale potato culture is possible only in the Julianehåb district, 10–15 km. inland from the coast along the fjords; there in normal summers a yield of 10–15 tons/10,000 m² may be expected.

44357. CHRISTENSEN, POVL ELO, and others. An epidemic of measles in southern Greenland 1951; measles in virgin soil, 1. (Acta medica scandinavica, 1952. v. 144, fasc. 4, p. 313-22, fold. map.) 14 refs. Other authors: H. Schmidt, O. Jensen, H. O. Bang, V. Andersen, and B. Jordal.

Account of the first measles epidemic on record in Greenland which began on Apr. 26, 1951; with information on epidemiological features of the disease; epidemics in other areas of the world; the area of the Greenland epidemic, its climate, population, living and sanitary conditions, trades and occupations, communications, etc.

\*\*Copy seen: DNLM.\*\*

44358. CHRISTENSEN, POVL ELO, and others. An epidemic of measles in southern Greenland, 1951; measles in virgin soil, 2; the epidemic proper. (Acta medica scandinavica 1953. v. 144, fasc. 6, p. 430-49, illus., tables.) 3 refs. Other authors: H. Schmidt, H. O. Bang, V. Andersen, B. Jordal, and O. Jensen.

Information is presented on methods of study; course of the epidemic, with details on the course in the larger communities; duration and course of the disease; complications and their incidence according to age, sex, etc.; treatment of complications; specific death rate of the epidemic, mortality in 1951; measles and pregnancy. The morbidity amounted to 99.9 percent with 45 percent of the cases complicated. Death rate was 1.8 percent.

\*\*Copy seen: DNLM.\*\*

44359. CHRISTENSEN, POVL ELO, and others. An epidemic of measles in

southern Greenland, 1951; measles in virgin soil, 3; measles and tuberculosis. (Acta medica scandinavica, 1953. v. 144, fasc. 6, p. 450–54, tables.) 7 refs. Other authors: H. Schmidt, H. O. Bang, V. Andersen, B. Jordal, and O. Jensen.

Information on the serious tuberculosis situation is presented and the effect of the measles epidemic evaluated. It is concluded that measles cause an aggravation of TB; a temporary reduction or absence of TB-allergy during measles infection is confirmed; several cases of post-primary erythema nodosum are reported.

Copy seen: DNLM.

44360. CHRISTENSEN, POVL ELO, and H. SCHMIDT. An epidemic of measles in southern Greenland, 1951; measles in virgin soil, 4; the significance of specific prophylaxis. (Acta medica scandinavica, 1953. v. 145, fasc. 2, p. 126–42, illus., tables.) 7 refs.

Account of prophylactic treatment with C-serum or gamma globulin administered during the epidemic. A moderate reduction of morbidity rate, attenuation of disease and lowering of frequency in complications were noted. The death rate was also lower except in tuberculous patients and premature children.

Copy seen: DNLM.

44361. CHRISTIANSEN, ARTHUR, 1912-, and W. MAKATSCH. Vögel im Norden. Radebeul, Neumann, 1956. 208 p. illus. 10 refs. Text in German. Title tr.: Birds in the North.

A popular account of birds found in Scandinavia and Finland, the Faroes, Iceland and Greenland, the text by Makatsch and 185 superb photographs taken by Christiansen, some of them in Special emphasis is placed on color. species nesting in the enumerated areas. Outline is given of the physiography of the arctic region; its avifauna, number of forms, numbers in general, ecology, and exploration. Each of the species, illustrated, is described in turn, its natural history, distribution, nesting habits and areas, food, migrations, etc. A final chapter (p. 197-207) by Christiansen, deals with photography, preferred cameras and their limitations, photographing birds in flight or on the nest, etc.

Copy seen: DLC.

44362. CHRISTIANSEN, BENGT. Blindpassasjerer. (Ottar, Tromsø, Oct. 1956. nr. 8, p. 34–36, illus.) Text in Norwegian. *Title tr.:* Stowaways. With modern fast shipment of freight, it is common for live insects to be imported with foodstuffs. They are specially searched for by customs officers to avoid introduction of new pests. A tropical beetle in a load of coffee beans and a Mediterranean grasshopper reached Tromsø, Norway, alive; these probably would not survive the cool climate, but the Colorado beetle is a potentially dangerous insect. Copy seen: DLC.

CHRISTIANSEN, J. V., see Brodthagen, H., and J. V. Christiansen. Polymorphic light eruptions; relation to ultraviolet light...sunshine. 1956 No. 44145.

44363. CHRISTIANSEN, KENNETH ALLEN, 1924— . Notes on Alaskan Collembola: I, a new genus and species of the family Isotomidae; II, three new species of arctic Collembola. (Psyche, Mar., Dec. 1951. v. 58, no. 1, p. 24–31, illus., plate 3; (II) no. 4, p. 125–40, plates 10–12.) 9 refs.

Contains (in pt. I) descriptions of Weberacantha n. gen. and W. octa n. sp. (type locality: 68°20′ N. 151° 30′ W. Anaktuvuk, Alaska, July 7, 1949), with notes on variation and relationships and measurements. This species was also taken from Mt. Richardson, just west of the Mackenzie delta in northwest Canada. In pt. II are descriptions of Schaefferia variabilis, Pseudanurophorus arctica and Anurida hammeri n. spp. collected at Umiat on the Colville River, and at Point Barrow in northern Alaska, by N. A. Weber in June-July 1949.

44364. CHRISTIANSEN, REIDAR THORALF, 1886—. Noai'der og finnferd. (Sameliv, Samisk Selskaps årbok 1951–1952, p. 51–61.) Text in Norwegian. Title tr.: Sorcerers and magic travel among the Lapps.

Discusses some aspects of Lapp magic and its influence on Norwegian folklore; several traditions are quoted.

Copy seen: DLC.

44365. CHRISTIE, K. J. Mining activity in the northerly portion of the Northwest Territories and its effect on the Eskimo. (Northern affairs bulletin, Dec. 1956. v. 3, no. 8, p. 14-17.)

Methods and operations involved in the four stages of mining activities are discussed: exploratory work, preliminary and advanced development, production. Large financial resources and specialized knowedge are required to bring a mining claim into production. Natives' development of mineral resources is impossible; but a small number of Eskimos might be employed in claim staking or as guides in exploratory work; in advanced development and during production, that labor would be invaluable. Eskimos would benefit from steady employment, better living conditions and educational facilities.

The meteorological observations are particularly valuable since they were obtained in a part of the central Arctic, an area not previously observed for any significant unbroken period. Observations were made with standard meteorological equipment from Apr. 2, 1950 to Apr. 10, 1951 by ice-floe station North Pole-2 drifting between 76° and 81°50' N. 189° and 202° E. All major meteorological elements were observed and recorded four or eight times a day. Methods of measurement and a brief discussion of certain results are given. Data are tabulated (appendix) and graphed on air temperatures, relative humidity, wind, visibility, cloud height, and on mean, maximum and minimum snow depth and density. Copy seen: CaMAI.

The two faunas are compared and their elements discussed. The bathymetric range of three arctic crinoids is stated as Heliometra glacialis: 2-755 fathoms; Hathrometra prolixa: 10-1088; and Ilycrinus carpenterii: 755-1563; that of 18 antarctic species is also given. Bathymetric distribution of the two faunas is graphically compared, and the frequency tabulated. Copy seen: DLC.

44379. CLARK. AUSTIN HOBART. 1880-1954. Echinoderms collected by Capt. Robert A. Bartlett in the sea about Baffin Land and Greenland. (Washington Academy of Sciences. Journal, July 15, 1936. v. 26, no. 7, p. 294-96, 4 illus.)

Contains a record of localities in Labrador, Greenland (East, West and North) and Baffin Island waters, and a systematic list of 17 species with distributional data. Copy seen: DLC.

44380. CLARK, AUSTIN HOBART, 1880-1954. The interrelationships of the subfamilies and genera included in the crinoid family Antedonidae. (Washington Academy of Sciences. Journal, Oct. 4, 1917. v. 7, no. 16, p. 504-512.)

Contains keys to the subfamilies and genera, among the later: Heliometra, Florometra, Psathyrometra, Hathrometra and Thaumatometra, occurring from Greenland to the Kara Sea, Bering Sea, Aleutian waters and Okhotsk Sea.

Copy seen: DLC.

44381. CLARK, AUSTIN HOBART, 1880-1954. On the temperature of the water below the 500-fathom line on the west coast of South and North America. (Washington Academy of Sciences. Journal, July 19, 1916. v. 6, no. 13, p. 413–17, table.)

A study of 417 Albatross records, including 103 in the Bering Sea. The most striking feature of the abyssal temperatures of the eastern Pacific is the very small range of maximum variation (cf. table), much less than in the east Atlantic. Average temperature for Bering Sea as a whole at 500-750 fathoms is 1.71° below that of the entire ocean. In the Gulf of Alaska at 500-1,000 f., temperature is approx. the same as in the Bering Sea as a whole, less cold at 1,000-2,000 f. more cold below 2,000 f.

44384. CLARK, HUBERT LYMAN, 1870–1947. North Pacific Ophiurans in the collection of the United States National Museum. Washington, Govt. Print. Off., 1911. xvi, 302 p., 144 illus. (U. S. National Museum. Bulletin 75.)

Contains introductory remarks, notes on distribution in the North Pacific, and on geographic, bathymetric, temperature and associational distribution, followed by descriptions of 189 species (in 51 genera) collected mostly by the U.S. Bureau of Fisheries steamer Albatross in 1900 and 1906. Twelve genera and 129 species are described as new. About 70 species are native to the Bering Sea, Aleutian waters, Gulf of Alaska and Okhotsk Sea. Four quite distinct faunas are recognized for the region, viz. Bering: 35 species; Honshu: 114; American: 9; and Oceanic: 18 species.

44390. CLEVE, PER TEODOR, 1840– 1905. The seasonal distribution of Atlantic plankton organisms. Göteborg, 1900. 369 p. 5 fold. maps. (Göteborgs kungl. vetenskaps- och vitterhets-samhälle. Handlingar, 4 följden, 3:dje häftet.)

Animal and plant organisms contained in North Atlantic water collections of 1898–1899 (No. 44391) are identified. Several hundred species are systematically listed with date and location of sampling, mean, max. and min. temperature and salinity of containing water, and known distribution. Summary review of arctic, boreal, temperate, tropical forms.

Copy seen: DLC.

44391. CLEVE, PER TEODOR, 1840–1905, and others. Les variations annuelles de l'eau de surface de l'ocean Atlantique. Göteborg, 1901. x, 22 p. diagr., 5 fold. maps. (Göteborgs kungl. vetenskapsoch vitterhets-samhälle, Handlingar, 4 följden, 3:dje häftet.) Text in French. Other authors: G. Ekman and O. Pettersson. Title tr.: The annual variations of the water of the surface of the Atlantic Ocean.

Determinations of annual changes in salinity, temperature, and plankton over the North Atlantic were made in 1898–1899 through cooperation of ships at sea. Decrease in salinity from tropical, temperate, arctic to arctic littoral waters, is represented on maps. Three characteristic types of plankton are distinguished as tropical, temperate, and boreal. Plankton changes are charted monthly. In Aug. colder arctic waters begin to overspread the western Atlantic, reaching the eastern Atlantic much later. In the Norwegian Sea the isohalines have been

found to progress in the opposite direction. The effect of these variations is important to fishing and other marine harvesting activities. *Copy seen:* DLC,

44393. CLODMAN, J. The distribution of cirriform clouds. Toronto, Jan. 3, 1956. 10 p. graph, 3 text maps. (Canada. Meteorological Service. Circular 2737, TEC 227.) 7 refs.

Data on the occurrence of cirriform clouds are analyzed from approximately 2,000 high level aircraft reports. Auxiliary map charts and a graph showing percentage occurrence of cirrus as related to cloud height can be used to determine the mean probability of cirrus occurrence for a given season and a given geographical area north of 30° N. lat. from approx. 150° W. to 20° E. long. The graph can also be used to give the probability of cirriform clouds occurring at a given time from 400 mb. or 500 mb. A general analysis of the data is given, and the method of analysis is discussed.

44394. CLODMAN, J. Visibility deterioration associated with operations of jet aircraft. (American Meteorological Society. Bulletin, Sept. 1956. v. 37, no. 7, p. 338–41, table.) 6 refs.

"The operation of aircraft may modify cloud and precipitation parameters sufficiently to cause a significant deterioration of visibility at an airfield. The conditions conducive to this effect are (1) large number of aircraft operating simultaneously in the vicinity of the airfield, (2) low temperatures, (3) light winds. An incident at Goose Bay [Labrador] on Dec. 4, 1954, is discussed in the light of the

above analysis."-Author's abstract. This incident (cf. H. Appleman) involved landing of 17 F-86 jet aircraft within about two hours, temperatures averaging about 10° F. During landings, conditions deteriorated generally to snow ceilings of 1,000 ft. and visibilities of one mile or less. Five miles away, visibility did not lower below five miles. ences between the author's and Appleman's conclusions are discussed.

44395. COACHMAN, LAWRENCE K., and others Gas enclosures in a temperate glacier. (Tellus, Nov. 1956. v. 8, no. 4, p. 415-23, diagrs., tables, text maps.) 16 refs. Other authors: E. Hemmingsen, and P. F. Scholander.

Techniques for separating gas from glacier ice and analyzing it for O2, N2, and CO2 are described. Results of systeminvestigations on Storbreen, glacier in central Norway, are reported. The gas pressure in the ice increased from atmospheric pressure in the upper part of the glacier to two atm. near the terminus, and the ice density increased The amount of gas varied similarly. widely, comprising from 1.8-7.8 percent of the ice volume. The various gas parameters are briefly discussed in relation to glacier mechanics.

COACHMAN, LAWRENCE K., see also Nutt, D. C., and L. K. Coachman. The oceanography of Hebron Fiord . . . 1956. No. 47116.

44396. COATS, ROBERT ROY, 1910-

Geology of northern Adak Island, Washington, D. C., U. S. Govt. Print. Off., 1956. p. 45-68, 9 illus. on 5 plates, 2 maps (1 fold.). (U. S. Geological Survey. Bulletin 1028-C. Investigations of Alaskan volcanoes.) 5 refs.

Contains results of U. S. Geological Survey volcano investigations under direction of G. D. Robinson. Previous reports are listed as Arctic Bibliography, Nos. 21239, 28575, 31654, 40715, 42513; another is No. 44937. About 73 sq. mi. on northern Adak (51°46' N. 176°40' W.) were mapped in 1946 by the author and W. F. Thompson. Two physiographic and geologic divisions exist: "a deeply glaciated southern area of folded, faulted, and intensely altered volcanic rocks of Paleozoic(?) age, intruded by gabbro and rocks of intermediate composition; and a mountainous northern area comprising remnants of three distinct basaltic volcanoes of Tertiary or Quaternary age." Five volcanoes in the southern area, probably of early Tertiary age, cannot be correlated with any of the three volcanic centers in the north. Glacial and Recent unconsolidated deposits and geologic history of the island are described. The volcanoes have apparently been inactive since early Quaternary time, but frequent earthquakes indicate instability of earth's Copy seen: DGS. crust.

44397. COATS. ROBERT 1910-. Geology of northern Kanaga Island, Alaska. Washington, D. C., U. S. Govt. Print. Off., 1956. p. 69-82. illus., 2 maps (1 fold.). (U. S. Geological Survey. Bulletin 1028-D. Investigations of Alas-

7 refs. kan volcanoes.)

Northern Kanaga (51°47' N. 117°15' W.) was mapped in summer 1946 by the author and W. F. Thompson. Oldest rocks recognized are a series of basalt flows and tuff beds (probably late Tertiary), remnants of a cone formed near the present north coast. After partial erosion of the cone, a basalt shield volcano, Mt. Kanaton, arose nearby. In late Pleistocene, the central part of the volcano and the cones on its flanks collapsed, leaving a large caldera in which the present cone of Kanaga Volcano built up. This has been intermittently active during historical time. Last eruptions (of basaltic lava) occurred in 1904 and 1906. Present activity is mild and fumarolic, but future eruptions can be expected .-From author's abstract.

44398. COATS, ROBERT ROY, 1910- . Reconnaissance geology of some western Aleutian Islands, Alaska. Washington, D. C., U. S. Govt. Print. Off., 1956. p. 83-100. 3 illus. on 2 plates, 2 maps (1 fold.). (U. S. Geological Survey. Bulletin 1028-E.) 9 refs.

Summarizes field and air observations by the author and W. F. Thompson in summer 1946 between Kasatochi and Attu (51°15'-53° N. 175°30' W.-173° E.), islands are of two main types: lowlying, wave-cut platforms, and mountains. A large land mass of metamorphic rocks intruded by granite probably existed in the Paleozoic(?) era. Volcanism occurred in the Mesozoic(?) and again in early Tertiary. During a period of submergence the Tertiary volcanoes were beveled by marine erosion. In late Tertiary and Quaternary, basaltic shield volcanoes and composite cones were built up along the northern margin of the present island belt, north of the Mesozoic(?)-early Tertiary vents. Downfaulting caused much of the southern part of the belt to disappear below sea level. Glaciers on the higher parts of the islands during the Quaternary greatly modified the topography. Many volcanoes are still active.

44403. CODY, W. J. New plant records from northern Alberta and southern Mackenzie District. (Canadian field-naturalist, July-Sept. 1956. v. 70, no. 3, p. 101–130, text map.) 20 refs. Pub. also as: Contrib. no. 1491 from the Botany and Plant Pathology Div., Science Service, Dept. of Agriculture, Ottawa, Canada.

Contains a systematic annotated list of about 250 species of flowering plants and vascular cryptogams. More than 150 of them are recorded in southern Mackenzie District, mostly in the Great Slave Lake region: Yellowknife, Snare River, Indin Lake. Antennaria leontopodioides (Indin Lake) and Haplopappus lanceolatus var. sublanatus (Salt Plain west of Ft. Smith) are described as new. List is included of the 26 localities (54°46′-66°05′ N. 111°10′-118°30′ W.) from which specimens are cited.

Contains summary of recent improvements in the Bombardier passenger snowmobile, including a new type track reinforced with steel wires, a new truck differential, and new Al-alloy driving sprockets. A new hauling unit incorporates a reinforced frame and cab-type body. The optimum load on flat hauls under good road conditions is around four Snowmobiles with a 5.83 to 1 cords. truck differential can haul six cords under ideal conditions. Methods of preparing roads for hauling include snow compaction with snowmobiles and plowing and Copy seen: DA. icing.

COLLIN, A. E., see Campbell, N. J., and A. E. Collin. A preliminary . . . oceanographic features of Foxe Basin . . . 1956. No. 44245.

**44417. COLLIN, J. E.** Scandinavian Pipunculidae. (Opuscula entomologica, 1956. Bd. 21, häfte 2–3, p. 149–69.)

Contains an alphabetic list of 55 Scandinavian species in collections of Fallén, Zetterstedt and Roth; a synopsis of taxonomic groups; descriptions of new species (not arctic), and notes on some others. Zetterstedt's collection includes some arctic species described in his Insecta lapponica (No. 27586) and Diptera Scandinaviae (No. 27584).

Copy seen: DSI.

44418. COLLINDER, BJÖRN, 1894— Lapparna, en bok om samefolkets forntid och nutid. Stockholm, Forum, 1953. 252 p., 41 illus. on 16 plates, 26 diagrs., 2 text maps. Approx. 200 refs. Text in Swedish. *Title tr.:* The Lapps, a book about their past and present.

Revised edition of No. 21272, which treated (in English) the physical, social, and cultural aspects of Lappish life. In the revision, attention is directed to the problems of a small group of primitive people faced with necessary adjustment to twentieth century standards and with trying to benefit from new contacts without losing the essential features of their own culture.

44419. COLLINDER, BJÖRN, 1894— Swedish research on the language and folklore of the Lapps. (Svenska landsmål och svenskt folkliv 1956. Årg. 79, häfte 1–4, whole no. 270, p. 25–50.)

Contains (p. 33-50) a bibliography of about 75 books and papers, and some 400 unpublished mss. in the Uppsala University Library (among them K. Wiklund's collection) and at the Institute for Dialect and Folklore Research at Uppsala. Introduction, surveys, investigators and their work from Johannes Tornalus, translator into Lappish of the Swedish Church service book (1648), The New Testament was to the present. published in Lappish in 1755. Since World War II, the Lapp department of the Landsmål och Folk minnesarkivet (The Institute for Dialect and Folklore Research) has sent out ten expeditions to record all Lappish dialects spoken in Sweden, also vocal music.

Copy seen: DLC.

44420. COLLINDER, PER ARNE, 1890- . Försök i fjällkanten. (Svenska turistföreningen, Stockholm, Årsskrift, 1950, p. 333–49, 8 illus. text map.) Text in Swedish. *Title tr.:* Research at the edge of the mountains.

Astronomical research in Swedish Lapland and its place in native life are discussed. As heavenly bodies tend to move in orbits rather than from east to west, they are of value as time indicators rather than directional signals. Natives' recognition of constellations, their legends, etc., are treated as well as scientific aspects of arctic illumination.

Copy seen: DGS.

44421. COLLINDER, PER ARNE, 1890-

. Midnattssolen. (Svenska turistföreningen, Stockholm. Årsskrift, 1953, p. 208–215, text map, diagr., fold. plate.) Text in Swedish. *Title tr.:* The midnight sun.

Importance of increased sunlight in summer to northern regions, particularly the Arctic, is described in a discussion of relationships between sun and earth. A photograph in 24 sections taken at hourly intervals with the camera facing

the sun, provide a 24-hr. view of midsummer in the Torneträsk-Abisko district of northwestern Sweden. Temperature, wind, clouds, and landscape elements are identified in the text accompanying the panorama. Copy seen: DGS.

44422. COLLINI, BENGT. On the origin and formation of the Fennoscandian Quaternary clays. (Geologiska föreningen, Stockholm. Förhandlingar, 1956. bd. 78, nr. 486, häft. 3, p. 528–36, table.) 25 refs.

The three different opinions regarding origin and formation of Quaternary water-laid clays are reviewed. Particle size, mineralogical composition, and other characteristics of clay samples from present Swedish glaciers are tabulated and discussed. High clay content of glacial clays and low clay content of tills and recent glacial oozes are rationalized. Discussion following presentation of the text is included. Copy seen: DGS.

44423. COLLINS, F. H. Radio in the Yukon Territory. A brief presented to the Royal Commission on Broadcasting. [Ottawa?] Apr. 1956. 9 p. text map. Mimeographed.

Commissioner of the Yukon Territory stresses lack of adequate radio links with the rest of Canada. Stations at Whitehorse, Dawson, and Watson Lake cannot receive transmission of the Canadian Broadcasting Corp. regularly nor those of other Canadian stations; but Yukon residents hear regular broadcasts of stations in western U.S. and Alaska and the Soviet North American service. powerful transmitter in southwestern British Columbia is recommended, also re-equipment and reorganization of existing local stations to re-broadcast transmissions from the south. Map shows relative frequency and quality of reception from Canada, U.S.A., & U.S.S.R.

Copy seen: CaOGB.

44424. COLLINS, HENRY BASCOM, 1899— . Archaeological investigations on Southampton and Coats Islands, N. W. T. (Canada. National Museum. Bulletin, 1956. no. 142, p. 82-113, 12 plates.) 7 refs.

Describes archeological work and artifacts collected in June-Aug. 1954, during an expedition sponsored by the National Museum of Canada, the National Geographic Society, and the Smithsonian Institution. Primary objective of the four-man party was to excavate Dorset

culture sites at Native Point, principal settlement of the extinct Sadlermiut Eskimos of Southampton Island. Artifacts from two Dorset sites, T 1 and T 2, are described and illustrated. A number of typical Dorset types, present at T 2, were absent at the larger and older T 1. Many of the types found at T 1 were new to the Dorset culture. faunal remains from the excavations were preserved. Mammal bones, numbering over 45,000, indicate seal as the most important food animal of both peoples. Dorset people, unlike Sadlermiut, made little use of caribou and had no dogs. Excavations were also made at Sadlermiut sites on Coats and Bencas Islands. Copy seen: DGS.

44425. COLLINS, HENRY BASCOM, 1899 - The T 1 site at Native Point, Southampton Island, N. W. T. (Alaska. University. Anthropological papers, May 1956. v. 4, no. 2, p. 63–89, illus., table.) 37 refs.

Discusses the 1954 and 1955 excavations at site T 1 discovered by G. D. Bell in 1950. The ivory, bone and flint implements are described in turn. The abundance of flint and flint artifacts, occurrence of rock crystal, scarcity of rubbed slate, nephrite and soapstone, and absence of chalcedony objects are noted. The chronological age of the site, dated by radioearbon to  $2,000 \pm 230$  years, is analyzed, the differences and common traits with other Dorset and pre-Eskimo sites are indicated and a classification as formative or proto-Dorset suggested. Burins, spalls, micro-blades, side and end blades are compared with those from pre-Eskimo flint sites in Alaska and Canada. These features and two others (rectangular side blades and backed blades) also occur at Old World Mesolithic The T 1 site, author concludes, brings further evidence of the Mesolithic affinities of the early Arctic flint sites, and of the latter as the immediate source of Dorset culture. The identification of animal bones shed light on the diet of the T 1 people who, having no dogs, hunted mainly sea mammals (predominantly seals) and birds. Copy seen: DLC.

44426. COLLINS, HENRY BASCOM, 1899 . Vanished mystery men of Hudson Bay. (National geographic magazine, Nov. 1956. v. 110, no. 5, p. 669–87, 17 illus. (13 col.), 2 text maps.) 3 refs.

Popular account of two Smithsonian

Institution-National Museum of Canada-National Geographic Society expeditions to Southampton Island led by the writer in summer 1954 and 1955. Sadlermiut and Dorset Eskimo sites were studied at Native Point southeast of Coral Harbour. on Coats Island, and Walrus Island (between Southampton and Coats). Evidence was found that the Sadlermiuts who died out in 1902-1903 were last survivors of the Dorset culture. Tools and weapons found at the sites closely resembled those of the European Stone Age men 8,000 years ago. Writer also comments on some of the birds and mammals seen, and describes harpooning a walrus that had been feeding on seals, as attested by masses of undigested seal skin in its stomach. COLLINS, HENRY BASCOM, 1899—, see also Harp, E. Arctic, 1. 1956. No. 45445.

44427. COLTON, ROGER BURNHAM, 1924—, and C. D. HOLMES. Geomorphology of the Nunatarssuak area, (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954. p. 27–52, illus., diagrs., 1 fold.) 2 refs.

Results of studies of glacial deposits and frost-action phenomena in relation to actual and potential transportation facilities, and the glacial history of the area as it relates to changes along the ice margin are reported. The characteristics of seasonal frost, permafrost, soil polygons, stone networks and stripes, solifluction features, avalanches, snow fields and small glaciers, and river icings are described. About half of the area is underlain by rubble produced by frost splitting of underlying bedrock, and few bedrock outcrops exist. Deposits left by glaciers which formerly covered the area include: till, outwash gravel, and kames, which cover about 45 percent of the region. Beach deposits around lakes and gravel deposits of present streams cover about 5 percent of the area. Extensive retreat of the larger ice-age glacier occurred more than 9,000 years ago. More recently the outlet glaciers have expanded 0.25-6 miles. The present trend toward marginal recession and lowering of the icecap began within the last 200 years. An exception to the general retreat is the present advance of North Icecap. About 10 percent of the land area is covered with perennial snow banks and small glaciers. Copy seen: CaMAI.

44429. COMMERCIAL FISHERIES REVIEW, U. S. Fish and Wildlife Service. [News notes.] (Commercial fisheries review, 1956. v. 18, no. 1-12. In continuation of No. 39329.)

Contains monthly statistics on fish landings, holdings, products, etc., including those from Alaska; brief information on possible use of Alaskan fishery waste (no. 1, p. 14); elimination of fish traps (no. 1, p. 16); economic data on U. S. and Alaskan fisheries, 1955 (no. 6, p. 41-43); bait herring (no. 7, p. 24); bulk shipment of Alaskan herring meal, and salmon waste as bait (no. 10, p. 8, and p. 11); a bottom fish survey in the waters off Southeast Alaska (no. 11, p. 45); etc. The sheefish or "inconnu" of northwestern Canada is described and its economic value noted (no. 9, p. 63-64); a decline of West Greenland cod yields due to falling temperatures is predicted (no. 12, p. 66-67). International projects, agreements, etc., covering the northwest Atlantic and the northern Pacific are noted (no. 2, p. 39, 40; no. 4, p. 29; no. 7, p. 66; no. 9, p. 45, 46, 54; no. 11, p. 68). Japanese agreements with Russia on Pacific salmon, and fishing in general, are outlined (no. 7, p. 68-71), and Japanese developments in North Pacific salmon fisheries discussed (no. 10, p. 74-75). Soviet regulation of salmon fishing in the northwestern Pacific (no. 5, p. 62) and the significance of Murmansk as a major fishing port (no. 11, p. 107-108) are outlined. Whaling and sealing, including the American Arctic are noted (no. 3, p. 10, 28-29; no. 6, p. 56-58; no. 7, p. 75; no. 9, p. 53-54, 57; no. 11, p. 73, 87, 95; no. 12, p. 60-61). *Copy seen:* DI.

44431. CONKEY, JAMES V. A. An unreported specimen of the whale, Balaenoptera physalus. (Journal of mammalogy, Aug. 1956. v. 37, no. 3, p. 455-56.)

Description of a skeleton of this species, from an animal 63 ft. long, captured in 1897 at Long Beach, California. Some morphometric data and the "history" of the skeleton, are presented. Copy seen: DI.

CONSOLI, G. see Visconti, S., and others. Primi studi . . . ibernazione sperimentale. 1955. No. 48763.

44432. CONSTRUCTION METHODS AND EQUIPMENT. Frozen-in-place piles support Air Force building in Alaska. (Construction methods and equipment, June 1956. v. 38, no. 6, p. 62-64, illus.)

Contains description of a new method of constructing building foundations in permafrost used at Bethel, Alaska. A special, 18-in. auger with a cone-shaped bit and carbide inserts is used to drill holes 33 ft. deep. Timber piles, provided with two sets of refrigeration pipes, are lowered into the holes, which were backfilled with a slurry of water and drill cuttings. CaCl. brine at  $-5^{\circ}$  C. was then pumped through the pipes to freeze the slurry. The freezing process takes 32 hr. Copy seen: DLC.

44433. CONSTRUCTION METHODS AND EQUIPMENT. Working frozen ground in the Arctic. (Construction methods and equipment, Apr. 1948. v.

30, no. 4, p. 92-95, illus.)

Describes construction of an earth-fill dam built by W. A. Kraner for Livengood Placers Inc. on Hess Creek, 90 miles from Fairbanks, Alaska, where active layer of permafrost is two ft. thick, and period of thaw is about 150 days/year. To strip the damsite of 400,000 cu. yd. of overburden (30 percent upward frozen moisture content), water at 52° F. was pumped through 300-400 sprinkler heads. Soil melted and washed off at 4-6 in./24 hrs. The sprinkled water was pumped upstream where it filtered into the stream bed and was re-used. The toes of the dam were frozen by circulating a refrigerant to prevent instability during the summer season. Also described in No. 21670. Copy seen: DLC.

Contains a brief description of the two apartment buildings, the second completed near the end of 1956, at the military post of Whittier. They were built at an approximate cost of 10.5 million dollars under the supervision of the U. S. Corps of Engineers. The apartments provide housing for military personnel. Copy seen: DLC.

44435. CONTRACTORS AND ENGI-NEERS. Electronic device marks safe route in Arctic. (Contractors and engineers, Oct. 1956. v. 53, no. 10, p. 120.)

Contains brief description of an electronic trailmarking device developed by the U.S. Army Corps of Engineers. Parallel wires buried in the snow, one on each side of the trail, are fed alternating current. A receiver mounted in a vehicle allows the driver to ascertain his position within the trail. The system has been tested in Greenland. Copy seen: DLC.

CONTRACTORS AND ENGI-NEERS. Ice-bound tractor goes back on the job (Contractors and engineers, Oct. 1956. v. 53, no. 10, p. 98, illus.)

Recovery of a caterpillar D4 tractor lost six months earlier in sea ice near Eureka, northwest Ellesmere is described. The operation required ten days, and the tractor showed surprisingly slight damage. Copy seen: DLC.

44437. CONTRACTORS AND ENGI-NEERS. North of the Arctic Circle. (Contractors and engineers, Oct. 1956. v. 53, no. 10, p. 118, illus.)

Contains notes and photographs (8) of flexible-type paving operations on a taxiway at the Thule Air Force Base. Each of the major operations from core sampling to protecting the freshly laid pavement is presented.

Copy seen: DLC.

44438. CONTRACTORS AND ENGI-NEERS. Rigs ready to work at 40 below as antarctic job nears completion. (Contractors and engineers, Oct. 1956. v. 53, no. 10, p. 84-85, illus.)

Contains description of low ground pressure caterpillar D8 tractors and other equipment designed and built to withstand cold weather and rough operating conditions. The tractor, which weighs 70,000 lb. has a ground pressure of only 4 psi, and 54 in.-wide tracks of special steel. Construction activities in the Antarctic preparatory to the IGY are discussed briefly. Copy seen: DLC.

44439. CONTRACTORS AND ENGINEERS. Swiftly erected shelter strong against wind, cold. (Contractors and engineers, Oct. 1956. v. 53, no. 10, p. 119.)

Contains brief description of an arctic shelter developed by the U. S. Army Corps of Engineers; it is capable of withstanding winds up to 100 m. p. h. and snow loads up to 75 lb./sq. ft. In a test at Fort Churchill, a 20 x 48 ft. structure was erected in 65 man-hours by unskilled troops working in temperatures of —35° F. The shelter can be erected in 90 min. by seven men under ideal conditions.

Copy seen: DLC.

44440. CONTRACTORS AND ENGINEERS. Winterized equipment wins first round in Antarctic battle. (Contractors and engineers, June 1956. v. 53, no. 6, p. 120-21, illus.)

Contains brief account of the use of specially constructed caterpillar tractors operating under extreme climatic conditions. The tractors are low-ground pressure D8, D4, and D2 crawlers. In storage, the Cats are lined up in the open air, with snow blocks between the machines, and covered with tarpaulins. In a tractor train the D8's each pull three sleds for a total tractor payload of 60 tons.

Copy seen: DLC.

4441. CONWAY, H. J. Ordnance in the Arctic. (Ordnance, May-June 1950. v. 34, no. 180, p. 429-31, illus.)

Contains brief summarization of Ordnance accomplishments with low-temperature tires, fuels, and lubricants. Five greases were tested on "Operation Greaseball," which consisted of two %-ton and 14 2½-ton trucks that travelled from Aberdeen, Md., in Aug. 1948 to Fairbanks, Alaska, via the Mojave Desert. A satisfactory global grease and improved arctic engine oil were obtained.

4442. COOK, DAVID RUSSELL, 1922- . Preliminary studies of the Tiphysinae of the United States; Acarina: Pionidae. (Entomological Society of America. Annals, May 1956. v. 49, no. 3, p. 263-74, 3 plates.) 7 refs.

Contains a key and descriptions of 11 species, three described as new. Tiphys (Tiphys) ornatus, occurring in Alaska is included. Copy seen: DLC.

44443. COOK, EDWIN FRANCIS.
1918— A contribution toward a monograph of the Scatopsidae (Diptera), part III; the genus \*Rhezoza\* Enderlein.
(Entomological Society of America. Annals, Jan. 1956. v. 49, no. 1, p. 1-12, 5 illus.) 2 refs. Issued also as Paper no. 3283, Scientific Journal Series, Minnesota Agricultural Experimental Station, St. Paul.

Contains discussion and description of the genus and its groups, keys to the groups and species, and descriptions of 11, seven of them new. R. similis comb. (Great Whale River, Quebec) is included.

Copy seen: DLC.

4444. COOK, EDWIN FRANCIS, 1918- . A contribution toward a monograph of the Scatopsidae (Diptera), part IV; the genus Swammerdamella Enderlein. (Entomological Society of America. Annals, Jan. 1956. v. 49, no. 1, p. 15–29, 6 illus.) 8 refs.

Contains a generic description, keys to the males and females of North American species and descriptions of 14, ten described as new. S. acuta n. sp. (Pajala, Norrbotten, Sweden), S. chillcotti n. sp. (Churchill, Manitoba) and S. pusilla (Anchorage, Alaska), are included.

Copy seen: DLC.

44445. COOK, **EDWIN** A contribution toward a mono-1918- . graph of the Scatopsidae (Diptera), part VI; the genera Scatopse Geoffroy and Enderlein. (Entomological Holoplagia Society of America. Annals, Nov. 1956. v. 49, no. 6, p. 593-611, 7 illus.) Pub. also as: Paper No. 3501, Scientific Journal Series, Minnesota Agricultural Experiment Station, St. Paul.

Contains discussion and descriptions of these genera of minute black flies, a key to the males and females of Scatopse, and descriptions of 15 species of which six are new. Four of the species are recorded in the North: S. notata (Alaska), S. lapponica (Swedish Lapland, northern Manitoba, Northwest Territories, Labrador, Yukon Territory), S. uncinata n. comb. (Cold Bay, Alaska) and S. flavocincta (Abisko, Swedish Lapland). Parts 1, 3, and 4 are listed as No. 39340 and supra, pts. 2 and 5 do not deal with arctic forms.

File seen: DLC.

COOK, EDWIN FRANCIS, 1918—, see also Benschoter, C. A., and E. F. Cook. A revision . . . Omophron . . . 1956. No. 43964. 44446. COOK, FRANK A. Additional notes on mud circles at Resolute Bay, Northwest Territories. (Canadian geographer, 1956. No. 8, p. 9-17, 5 illus., 5 tables.) 4 refs. In sequel to No. 36015.

Methods of excavating some 50 mud circles on Cornwallis Island, summers 1953-1955, are described. The 1,429 excavated stones are classified by shape, nearly half of them (44 percent) sharply angular. Contents of seven plugs exhumed en masse are classified according to volume and weights of fines and stones. Marked features of these circles are the unweathered appearance of stones on top compared with those round about, and the apparent power of the circles to recuperate when disturbed. Findings strengthen the theory that the circles are injection phenomena in which fines flow upward and spread out at the surface. Copy seen: DGS.

44447. COOK, FRANK A. Near surface soil temperature measurements at Resolute Bay, Northwest Territories. (Arctic, 1955, pub. 1956. v. 8, no. 4, p. 237-49, 2 illus., graphs, 4 tables.) 8 refs.

Based on daily readings 1951-1955 by meteorological observers at Resolute, supplemented by author's measurements in summers 1953-1955 and winter 1953-1954. Pt. 1 concerns soil temperatures within the six-ft. overburden of frozen gravel and shattered rock overlying limestone bedrock. Daily, monthly and annual average soil temperatures and the influence on them of air temperatures, insolation, and precipitation are discussed. Pt. 2 is a preliminary report on a special study made in fall 1955 on the freezeback in the active layer. Readings were taken at four-hourly intervals, Aug. 28-Oct. 1. The period of the "zero curtain" (period necessary for soil water to freeze). penetration of the 32° F. freezing line, and moisture content and migration are discussed. Copy seen: DLC.

44448. COOK, FRANK B., and D. L. GOODMAN. Design of the Eklutna Project, Alaska. (American Society of Civil Engineers, Power Division. Journal, Dec. 1956. v. 82, no. P06, paper 1132, 26 p. illus., diagrs., table.)

The design, purpose, and function of the Eklutna Project, a hydroelectric power development of the U. S. Bureau of Reclamation near Anchorage, are described. Constructed during 1951–1955, it provides an estimated average annual firm energy of 140 million kw-hrs. The power plant is located on the Glenn Highway with transmission lines running to Palmer and Anchorage. Illustration of plant and profile drawings of major project structures are included.

44449. COOK, JOHN CALL, 1918—. An electrical crevasse detector. (Geophysics, Oct. 1956. v. 21, no. 4, p. 1055–1070, illus., diagrs.) 8 refs.

Contains description of the geophysical method devised for the United States Dept. of Defense for detecting crevasses. Results of field tests are reported. method is similar to the 4-electrode method of measuring earth resistivities but differs in that an alternating dielectric displacement-current field is used instead of a conduction-current field, since ice is essentially a non-conductor. systems tested in Greenland and Antarctica continuously indicate or record the capacitive transfer reactance between pairs of electrode sleds or vehicles. The systems have been operated successfully at speeds up to 20 m. p. h. Representative crevasse-detector recordings and circuit diagrams are presented. Some applications of the method in other fields Copy seen: DLC. are suggested.

44450. COOK, JOHN CALL, 1918—. Some observations in a northwest Greenland crevasse. (American Geophysical Union. Transactions, Dec. 1956. v. 37, no. 6, p. 715–18, illus., diagr.) Ref.

An average-size crevasse located about 65 km east of the coast on Hayes Peninsula was studied in detail during two months in the summer of 1955. It measured about 300 m. long and 15 m. deep but was invisible from the surface. A wide variety of ice forms was observed. Temperatures remained nearly constant but water in its lower portion fluctuated with the weather. Acoustical characteristics are noted. The interior of the crevasse is illustrated, and several cross-sectional diagrams are given.

Copy seen: DLC.

44451. COOK, PAUL M. Consolidation characteristics of organic soils. (In: National Research of Canada. Associate Committee on Soil and Snow Mechanics. Proceedings of the Ninth Canadian Soil Mechanics Conference, December 15 and 16, 1955. Ottawa, Oct. 1956. Technical memorandum no. 41, p. 82–87, 4 graphs.)

A compilation of test data, with graphs showing that a relation exists between the coefficient of compressibility and moisture content over a wide range of soils, from pure peat to organic clay silts. Relationship is also shown between moisture contents and such soil pr perties as specific gravity, void ratio, and submerged weight. These relationships are sufficient to permit calculation of settlement without lengthy consolidation tests.

44453. COOKE, WILLIAM BRIDGE, 1908- . The genus Phlebia. (Mycologia, May-June 1956. v. 48, no. 3, p. 386-405.) Pub. also as: Scientific Paper No. 1439, Washington Agricultural Experimental Stations, Pullman, Project No. 1047.

Contains a discussion of this fungus genus, a key to the species and descriptions of nine, seven new. P. radiata, on the rotting wood of hardwood and coniferous trees and shrubs (73 hosts listed) occurs in Alaska. A list of doubtful and excluded species is appended.

Copy seen: DA.

44454. COOKSON, BRIAN A. The cardiac effects of certain hypotensive drugs and muscle relaxants in hypothermia. (Royal Society of Medicine, London. Proceedings, 1956. v. 49, no. 6, p. 364-65, illus.) Refs.

Following a description of severe bradycardia and other conditions in the hypothermic dog below 19° C., the author discusses his work on the quaternary nitrogen compounds; their action in relieving bradycardia in hypothermic animals is explained.

Copy seen: DNLM.

**44455. COOLIDGE, KARL R.** The North American species of the genus *Erebia*: Lepidoptera. (Entomological

news, Feb. 1908. v. 19, no. 2, p. 73–75.)

Contains descriptions of ten species and varieties, of which seven are recorded in Alaska and "Arctic America."

Copy seen: DA.

**44456. COOPER, A. C.** Arctic air base. (Royal Engineers journal, Dec. 1955. v. 69, no. 4, p. 339–44, photos.)

Describes organization of the work, port facilities, construction of the main airstrip, and certain details of the structures and utilities at Thule, Greenland as performed by the United States Corps of Engineers. A list of the mechanical equipment used for construction is included.

Copy seen: DGS.

COORD, A. B., see Mavor, G. E., and others. Potassium and the hypothermic heart. 1956. No. 46663.

44457. COPLAND, A. D. Natural cold storage in the Canadian North. Ottawa, Feb. 1956. 8 p. 4 diagrs. (Canada. Defence Research Board. Arctic report, no. 3/55.)

Several storage cellars constructed in permafrost at Aklavik, Cape Bathurst, Herschel Island, and other points in the Canadian Arctic are described and diagrammed. The type found most effective is constructed by digging vertical shafts to a depth of six ft., and forming a chamber at this depth measuring 8-14 ft. sq. with a total depth of about 20 ft. Trap doors cover the shaft entrance which is further protected by a slanting roof covered with turf. A less effective but simpler construction consists of a shallow horizontal tunnel dug into a sand or gravel ridge. Problems which restrict the use of such cellars include excavation difficulties, thawing of the active layer, Copy seen: CaMAI. and drainage.

44458. COPP, STANLEY S., and others. Protection of utilities against permafrost in northern Canada. (American Water Works Association. Journal, Sept. 1956. v. 48, no. 9, p. 1155–68, diagrs., table.) 10 refs. Other authors: C. B. Crawford and J. W. Grainge.

Contains results of preliminary studies from 1953-55 on soil temperatures around water and sewer pipes under moss and bare ground at Yellowknife relative to the design of water-supply installations in permafrost regions. The method of measurement and instruments used are described. The climatic and soil characteristics of the area are outlined, and

its underground water system (designed in 1945) is described. Data are tabulated and graphed on ground temperatures at depths of 4–10 ft. for selected months, freeze and thaw penetration under a moss cover and under bare ground, annual soil-temperature variations to a depth of 13 ft., the relation between air and soil temperature, and grain size of the soils investigated. Underground systems of Aklavik, Churchill, Dawson, Fairbanks, Flin Flon, Fort Smith and Whitehorse are also briefly described.

Copy seen: DLC.

44459. COPP, STANLEY S. Two water supply systems of northwestern Canada. (In: Alaskan Science Conference . . . .

1952. Proceedings, pub. 1954, p. 62-63.) The supplies at Yellowknife and Fort Smith are described. In the first, the water is heated Nov.—May. Outgoing water from the pumphouse is maintained at about 41° F. and during March when 80 percent of the outgoing water is recirculated the temperature of the return water is about 40° F. The Fort Smith water varies from 32.8° F. in Jan. to 65° F. in Aug. In Jan. water leaving the plant at 42° F. is cooled to 35° F. at the end of the system. Bleeders at dead-ends are utilized.

44463. CORBEL, JEAN, 1920— . Le climat des régions voisines du Pôle Nord. (Norois, Oct.—Dec. 1956. 3° année, no. 12, p. 389—98, graphs, map, table.) 13 refs. Text in French. *Title tr:* The climate of regions near the North Pole.

Contains a general discussion of the temperate regime at the surface and aloft in the north polar area. Typical vertical temperature distributions to above 8,000 m. are diagrammed for Thule, Alert, Spitsbergen, and Eureka. Ice island data are also cited. Monthly mean, absolute maximum, and absolute minimum temperatures are tabulated for a number of temporary and permanent arctic stations. Copy seen: DLC.

44464. CORBEL, JEAN, 1920—. L'essor du Groenland. (L'information géographique, May-June 1956. Année 20, no. 3, p. 98–102, 2 text maps.) Ref. Text in French. *Title tr:* The progress of Greenland.

Reviews former Danish policy isolating the Greenland Eskimos from the outside world, its effects, Greenland's present status as part of Denmark. The economic importance of northward migration of fish is noted, also experiments in sheep raising, discovery of lead-zinc deposits in the northeast and approaching exhaustion of cryolite deposits. Future utilization of Greenlanders in mining operations, use of wind and water power for energy, advances in agriculture in the

southeast, increase in reindeer herding (started in 1953), and development of mineral industries are discussed. Tourism and increasing use of Greenland airfields on transpolar flights are mentioned as factors in Greenland's future. Map shows present and planned air routes.

44465. CORBEL, JEAN, 1920—. L'hiver dans l'arctique Nord-Américain, de l'Alaska au Groenland. (Revue Canadienne de géographie, Apr.-Sept. 1956. v. 10, no. 2-3, p. 81-96, 17 charts, graphs, 3 tables.) 18 refs. Text in French. Summary in English. Title tr.: Winter in the North American Arctic, from Alaska to Greenland.

The Arctic is defined as those regions having more than 300 days of frost, the sub-Arctic, 270-300 days of frost. Cold poles are on the Yukon-Alaska border below the Arctic Circle, northwest Ellesmere, and center of the Greenland icecap. Temperatures are discussed for the Oct.-Nov., Dec.-Jan., Feb.-Mar. periods, with special emphasis on the high temperatures on the eastern side of Baffin Bay-Davis Strait relative to those on the western side. Zones of higher precipitation are along the Atlantic and Pacific coasts; dry zone extends from northeast Greenland across the Canadian Arctic Islands. Windiest regions are central Greenland and coastal Alaska. Effect of wind-chill on human settlement is briefly discussed. Climatic data are given in charts and graphs. Biographical sketch of the writer is given by E.-M. Bernard on p. 119 of this issue. Paper is discussed in Revue de géographie de Lyon 1957, t. 32, no. 2, p. 181-83. Copy seen: DGS.

44466. CORBEL, JEAN, 1920- . A new method of study for limestone regions. (Revue Canadienne de géographie, Oct.-Dec. 1956. v. 10, no. 4, p. 240-42, table.)

Rate of erosion in limestone can be measured if the average limestone content of the water and the total annual run-off are known. Erosion rates may be compared in regions of different climates, and time estimated for a bed of limestone to erode completely in a given climate. Annual rates of erosion (to the 1/1000 mm. and 1/100,000 in.) in some typical districts are given according to seven climatic types, two of them arctic. The "dry arctic," is represented by Blomstrandhalvøya (Vestspitsbergen),

Swedish Lapland, Baltic islands, and interior Alaska (Tanana); and the "humid arctic," by Svartisen (North Norway), and Gold Creek (Juneau, Alaska).

44475. COTTONY, H. V. Some observations of atmospheric radio noise in the Arctie. Boulder, Col., May 1, 1956. 11 l. and 35 l. diagrs., graphs, map. (U. S. National Bureau of Standards. NBS project 8220-10-8255 (1431); NBS report 3582.) 4 refs.

Noise intensities were measured twice daily from shipboard during the period from July 6-Aug. 15, 1947, at frequencies ranging from 15 kc.-25 mc. Measurements were made in the North Pacific, Bering Sea, and the Arctic Ocean from latitudes 22°-72° N. Average noon and midnight observations are graphed for each of 25 days, and median values are compared to theoretical data. The order of magnitude of the measured values agrees reasonably well with predicted values except at the high frequency end of the band. Copy seen: DBS.

44476. COUES, ELLIOTT, 1842-1899. A check list of North American birds. Salem, Mass., F.W. Putnam & Co., 1873. 137 p.

A simple catalog of scientific and vernacular names of 635 species with

some unnumbered varieties and subspecies (778 by actual count). Some Alaska and Greenland species are included. This work was reprinted in 1879, and a second edition published in 1882 (infra). Emendations were offered by R. Ridgway (No. 47584).

Copy seen: DLC.

44477. COUES, ELLIOTT, 1842–1899. The Coues check list of North American birds; 2d ed. revised to date, and entirely rewritten under direction of the author, with a dictionary of the etymology, orthography, and orthoepy of the scientific names, the concordance of previous lists, and a catalogue of his ornithological publications. Boston, Estes and Lauriat, 1882. 165 p.

Contains an analysis of the two editions, with a list of ten "subtrahend names" and another list of hundred and ten "addend names", including at least 32 species native to Alaska, Greenland and "arctic America," also remarks on the use of the names. The check list itself, contains 888 species. Copy seen: DLC.

The history of exploration of the Arctic Ocean and the discovery of ice islands are outlined, and a synopsis of scientific investigations made on T-3 is given with summaries of the general results obtained to date. Research conducted on T-3 included: oceanography of the Arctic Ocean, its ice cover, and meteorological conditions; the properties of the ice island itself, its surface and subsurface features, flora, fauna, and inorganic surface deposits. Seismological studies were made of the force of island rotation, and its vertical and lateral movements both of short and long duration. The characteristics of ice islands, their correlation with the ice shelf, summer conditions on T-3, surface deposits on T-1, T-3, and the Ellesmere ice shelf, and the density and stratification of the ice to a depth of 110 ft. are described. The age of T-3 and its possible origin are discussed, and the formation of the ridge and trough systems is examined. The causes for the clockwise rotation of the island are analyzed mathematically. *Copy seen:* DLC.

44484. CRARY, ALBERT PADDOCK, 1911— Geophysical studies along northern Ellesmere Island. (Arctic, 1956. v. 9, no. 3, p. 155–65, 2 text maps, diagrs., graphs.) 7 refs.

During late June 1954 the writer and G. F. Hattersley-Smith (Ellesmere Ice Shelf Expedition) made 19 line soundings, three hydrographic stations, and took 13 Phieger bottom core samples along the Ellesmere coast between Markham and M'Clintock Bays (approx. 83°00'-15' N. 71°-77° W.) In late summer, 25 seismic soundings (19 successful) were attempted through the ice shelf from Ward Hunt Island to Cape Discovery (approx. 74°-77° W.). Some results of the bathymetric program are given, also temperatures and salinities, and magnetic declinations. Soundings data are supplemented by those of R. G. Marvin on the Peary Expedition 1906 in the same area. Marvin's work is discussed by V. C. Bushnell, q.v. Copy seen: DLC.

44485. CRAWFORD, JOHN E., and J. PAONE. Facts concerning uranium exploration and production. Washington, D. C., U. S. Govt. Print. Off., 1956. vii, 130 p. 13 illus., fold. diagr., fold. map. (A Bureau of Mines handbook) approx. 325 refs.

Contains general geological and mineralogical information, and deals further with uranium prospecting (favorable areas of U. S.), sample testing and mineral specimens, maps on uranium areas, radioactivity counters, prospecting and staking claims, exploration and development, mining, milling, refining. Under each section are selected references. Information offices for each of 18 uranium-bearing areas in the U. S., including Alaska, selected maps and references are listed. Copy seen: DGS.

44486. CRESSON, EZRA TOWN-SEND, 1838-1926. The Cresson types of Hymenoptera. Philadelphia, Academy of Natural Sciences, 1916. 141 p. (American Entomological Society. Memoirs no. 1.)

Contains a list of 2,737 species "described by the author, arranged alphabetically under each family, with reference to the original description, sex, number of the type-specimen as recorded in the catalogue of types in the collection of the American Entomological Society, locality and condition of the specimens as found during the winter of 1913–14." At least 15 of the species are native to Alaska, the Aleutian Islands and northern Canada. Dr. Cresson's entomological writings (69) during 1861–1911 are listed. This work is supplemented by No. 44849.

Copy seen: DLC.

44487. CRESSON, EZRA TOWN-SEND, 1876–1948. Descriptions of new genera and species of the dipterous family Ephydridae. Paper 8. (Entomological news, Mar. 1930. v. 41, no. 3, p. 76–81.)

Contains descriptions of 12 new species from various regions, among them Hyadina macquarti n. sp. from Skagway and from Anchorage, Alaska. Papers 1-7 of this series do not contain arctic material.

Copy seen: DA.

44488. CRESSON, EZRA TOWN-SEND, 1876–1948. New North American Diptera: Scathophagidae. (Entomological news, Apr. 1918. v. 29, no. 4, p. 133– 37.)

Contains descriptions of nine new species from various regions, among them Scathophaga nigrolanata n. sp. from the west coast of Greenland, 1891.

Copy seen: DA.

44489. CRESSON, EZRA TOWNSEND, 1838–1926, and E. T. Cresson, Jr. The types of Hymenoptera in the Academy of Natural Sciences of Philadelphia other than those of Ezra T. Cresson. Philadelphia, Academy of Natural Sciences, 1928. 90 p. (American Entomological Society. Memoirs no. 5.)

Contains an alphabetical list of some 1,300 type-species and subspecies arranged by families, with reference to sex, specimen number, locality and conditions. Another list of the type species, arranged by the authors who described them, is appended, p. 75–90. A few species are recorded from Alaska, northern Canada and Greenland. This posthumous paper,

completed and edited by Dr. E. T. Cresson, Jr., is supplementary to No. 44486.

44490. CRIDDLE, STUART. Drummond's vole in Manitoba. (Canadian field-naturalist, Apr.-June 1956. v. 70, no. 2, p. 78-84, illus., 4 tables.)

Contains brief description, measurements and notes on breeding and young, nests, etc.; tabulated data are given on Microtus pennsylvanicus drummondii, relative abundance; its food, swimming, fighting, etc. are sketched. Its economic status is considered: pest of cultivated grains but food for some valuable fur-bearing animals; and measures for control are outlined. The study of this vole, which found throughout the province, is based partly on specimens from Churchill.

Copy seen: DA.

of wolves hunting caribou. (Journal of mammalogy, Aug. 1956. v. 37, no. 3, p. 337-46.)

Attempts of the Alaskan wolf (Canis lupus) to catch barren ground caribou (Rangifer arcticus) were studied in various parts of Brooks Range, Alaska, during 13½ months of 1953-54. Moving pictures of caribou and wolves were being taken for the Walt Disney Studio. "... wolves have great difficulty catching healthy adult caribou, and even calves are not often overtaken except in the confusion of a large herd." At least half of the kill observed involved crippled or sick caribou representing 1.8 percent among stragglers, and even lower among the main herds. \*\*Copy seen:\*\* DSI.

44492. CROASDALE, HANNA THOMPSON, 1905— . Freshwater algae of Alaska 1; some desmids from the interior, part 2, Actinotaenium, Micrasterias and Cosmarium. (American Microscopical Society. Transactions, June 1956. v. 75, no. 1, p. 1–70, illus., tables, map.) Over 100 refs.

Description of some 250 forms of these algae collected from all parts of Alaska during summer 1951. In addition to morphological data, such are supplied on occurrence, relations with other forms, location of find, altitude, pH and type of locality. The paper is richly illustrated

with camera lucida drawings. The first part of this study was listed as No. 39,400. **Copy seen:** DNLM.

**44493.** CROCKER, ROBERT L., and J. MAJOR. Soil development in relation to vegetation and surface age at Glacier Bay, Alaska. (Journal of ecology, July 1955. v. 43, no. 2, p. 427-48, 4 illus., 16 graphs, 2 tables.) 13 refs.

Ice in this region (58°30'-59° N., 136°-137° W.) has receded about 60 mi. since the post-Pleistocene "Little Ice Age." From the most recently deglaciated areas to the terminal moraine, the vegetation sequence is: bare surface, pioneer stage (Salix, Dryas, Epilobium, etc.), alder thicket, spruce-cottonwood-alder, spruce forest. Field observations of soil properties were made in summer 1952 during an expedition led by D. B. Lawrence (q. v.). Laboratory analyses of soil samples are described and graphed. Rate of development of some characteristics of the forest floor, and changes in pH, organic carbon, total nitrogen, calcium carbonate, and bulk density of fine earth are reported and related to surface age and developing vegetation. Climatic data are given for meteorological stations at Gustavus, Cape Spencer and Haines. Copy seen: DLC.

44494. CROMBIE, GORDON PEERS, 1916—. Geology of the Barrington Lake area, Granville Lake division, Manitoba. Winnipeg, 1948. 16 p. fold. map 14 x 21 in., table. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Preliminary report 47–6.) 4 refs.

Map (scale 1 in.: 1 mi.) covers area 56°45'-57° N. 100°00'-15' W., in the Lynn Lake region, 120 mi. north-northeast of Sherridon. Mapping was done in 1947. Physical geography and access are briefly described. The Precambrian bedrock consists of volcanic and sedimentary rocks of the pre-Sickle (Wasekwan) series and the post-Sickle intrusives ranging from gabbro to granite. None of the Sickle sedimentary series, found in the adjacent map-area (cf. No. No nickel-copper has been identified. orebodies of commercial importance have been discovered to date. Geology and mineralization of the properties of Lynbar Mines Ltd., Nickel Lake Mines Ltd., and Barrington Lake Copper Mines Ltd. are described. Copy seen: DGS.

44495. CRONQUIST, ARTHUR JOHN, 1919— . Notes on specimens of American plants in European herbaria. (Leaflets of western botany, May 13, 1953. v. 7, No. 2, p. 17-31.)

Includes discussion of Aster subspicatus and related species, occurring in Alaska and the Aleutian Islands; of Petasites frigidus varieties ((corymbosus, hyperboreus, nivalis, frigidus and palmatus) some native to Alaska and northern Canada, and of Senecio bivestitus recorded in Alaska and Yukon Territory. Based on a study of material in London and Paris in 1951 and 1952.

44499. CROWSNEST. The Labrador and the DEW Line. (Crowsnest, Jan. 1956. v. 8, no. 3, p. 13–18, 9 illus.)

Contains account of the operations of the Canadian ice-breaker Labrador as senior ship in a task group of 14 vessels delivering supplies for radar stations in the Foxe Basin area of the Eastern Arctic in 1955. Navigational control stations were installed at Cape Fisher (Southampton Island) and Cape Enauolik (Baffin Island). The work of the ice-breaker in addition to convoying, consisted of survey and hydrographic work, supply operations, communications handling, and medical responsibilities.

Copy seen: DLC.

44500. CROWSNEST. Labrador keeps 'em healthy. (Crowsnest, Sept. 1956. v. 8, no. 11, p. 19–20, illus.)

Medical facilities aboard the Canadian ice-breaker Labrador are described: permanent equipment is similar to that in any small hospital. The ship's crew are checked thoroughly; their general health mostly improves during cruise.

Copy seen: DLC.

44501. CROWSNEST. Symbol of arctic friendship; nations drawn together by exploration of North. (Crowsnest, May 1956. v. 8, no. 7, p. 14-15, illus.)

Contains a brief historical account of a desk in the White House. It is made of timbers from H. M. S. Resolute which was abandoned during the Franklin search in 1854 at 74°41′ N. 101°22′ W. The ship, found and later returned by the U. S. to Great Britain, was salvaged in 1880; the best oak timbers were used to make the desk which Queen Victoria presented to the President of the United States.

Copy seen: DLC.

44502. CRUICKSHANK, J. S. Summit detachment. (Royal Canadian Mounted Police quarterly, Oct. 1956. v. 22, no. 2, p. 106-107, illus.)

Describes establishment of Northwest Mounted Police camp Feb. 1898 at the summit of Chilcoot Pass on the Southeast Alaska—Yukon border during the Klondike Gold Rush. Collection of customs duties from gold miners entering the Yukon began on Feb. 26. Between 25 and 30 thousand people crossed the summit, and \$174,470 in duties was collected to June 30. Copy seen: DLC.

44503. CRUMB, FRANCIS P. Engineer support of DEW Line transportation. (Military engineer, Mar.-Apr. 1956. v. 48, no. 322, p. 111, illus.)

Contains brief description of United States Corps of Engineers cargo-discharge operations from ships into landing craft and off-loading to beaches on the eastern sector of the DEW Line. Principal means of land transportation consisted of stoneboats, heavy timber steelshod sleds, 9 x 15 ft. towed by tractors. Approximately half of the cargo consisted of drummed POL products. The remainder was palletized.

CSAGI. See International Geophysical Year, 1957–1958. Special Committee.

44504. CUGURRA, F., and L. BALDINI. Ganglioplegici ed ipermetabolismo da freddo. (Archivio Italiano di scienze farmacologiche, 1956. v. 6, ser. 3, fasc. 3, p. 224-25.) 2 refs. Text in Italian. Title tr.: Ganglioplegics and hypermetabolism due to cold.

Contains a discussion of the action of some drugs upon the vegetative, ganglionic and central nervous components; the authors' experiments with a combination of hexametonium-novocaine, the action of nicotine, etc. Copy seen: DNLM.

44505. CUGURRA, F., and L. BALDINI. Sulla capacità dei cosiddetti ganglioplegici di bloccare la spinta ipermetabolica da freddo, 1; scopo delle ricerche, metodi e azione della nicotina. (Società italiana di biologia sperimentale. Bolletino, 1955. v. 31, no. 7–8, p. 883–85.) Text in Italian. Titte tr.: The capacity of so-called ganglioplegics to block the hypermetabolic response to cold, 1; scope of investigation, mode of action of nicotine.

Account of O<sub>2</sub>-consumption in male rats exposed for eight days to a temperature of —8 to —10° C. Nicotine in the higher doses applied (g 0.01/kg.) caused a rapid block of metabolic spurt due to cold; half of the dose caused a considerable shortening of the cold-response; the quarter dose had only a modest effect.

\*\*Copy seen: DNLM.\*\*

44506. CUGURRA, F., and L. BALDINI. Sulla capacità dei cosiddetti ganglioplegici di bloccare la spinta ipermetabolica da freddo, 2; azione del tetraetilammonio (TEA). (Società italiana di biologia sperimentale. Bolletino, 1955. v. 31, no. 7–8, p. 886.) Text in Italian. *Title tr.:* The capacity of so-called ganglioplegies to block the hypermetabolic response to cold, 2; action of tetraethylammonium (TEA).

TEA administered in doses of g 0.025 and 0.050 per kg. had no effect on the increased O<sub>2</sub>-consumption caused by cold environment. This condition is compared with the effect of nicotine reported in the first part of this study.

Copy seen: DNLM.

44507. CUGURRA, F., and L. BALDINI. Sulla capacità dei cosiddetti ganglioplegiei di bloccare la spinta ipermetabolica da freddo, 3; azione dell' esametonio. (Società italiana di biologia sperimentale. Bolletino, 1955. v. 31, no. 7–8, p. 887–88.) Text in Italian. Title tr.: The capacity of so-called ganglioplegies to block the hypermetabolic response to cold, 3; action of hexamethonium.

Of the dosage tried, only higher concentrations of this drug (g 0.01 and 0.018 per kg.) reduced or blocked increased oxygen consumption caused by cold. In this it differs fundamentally from TEA.

Copy seen: DNLM.

44508. CUGURRA, F., and L. BALDINI. Sulla capacità dei cosiddetti ganglioplegici di bloccare la spinta ipermetabolica da freddo 4; azione della novocaina. (Società italiana di biologia sperimentale, Bolletino, 1956. v. 32, no. 3-5, p. 182-83.) Ref. Text in Italian. Title tr: The capacity of so-called ganglioplegies to block the hypermetabolic response to cold, 4; action of novocaine.

Account of experiments with rats kept at -10° to -8° C., and at room temperature (20° C.). In the latter, administration of novocaine in a dose of 0.175 g/kg. reduced O<sub>2</sub>-consumption by nearly 50 percent. In cold-exposed animals such, and lower doses had no effect.

Copy seen: DNLM.

44509. CUGURRA, F., and L. BALDINI. Sulla capacità dei cosiddetti ganglioplegici di bloccare la spinta ipermetabolica da freddo, 5; azione della associazione esametonio-novocaina. (Società italiana di biologia sperimentale, Bolletino, 1956. v. 32, no. 3-5, p. 183-84.) Text in Italian. Title tr: The capacity of socalled ganglioplegics to block the hypermetabolic response to cold, 5; the action of combined hexamethonium-novocaine.

The two substances administered, combined, in two concentrations showed an inhibiting effect on metabolic rise caused by cold. The two substances appear to be pharmacologically indifferent to each other.

44513. CUSHMAN, CHARLES SIGAFUS. Interdiurnal temperature variations in Alaska. Seattle, 1953. ix, 115 l. 2 fold. graphs, 20 maps incl. 1 fold., tables. 40 refs. M. S. thesis, University of Washington.

The interdiurnal variabilities of the daily maximum, minimum, and mean air temperatures at the surface were studied for each month at 15 stations uniformly distributed over the mainland and southeast coast of Alaska using data for 1943-The results are given in tabular and graphic form. Isolines of the values are mapped for Jan., Feb., Apr., July, Aug., and Oct., variabilities were found to be largest in winter and smallest in summer over much of Alaska. In Southeast Alaska, however, the variability of the daily maximum and the daily mean are greatest in summer. Extreme variations in the interior of Alaska are generally greater than those in other parts of the world.

44520. D., H. B. Permafrost. (Building research in Canada, Dec. 31, 1956.

v. 2, no. 4, p. 116-17.)

Permafrost and its effects on building foundations are summarized. Topics discussed include: occurrence and distribution of permafrost, foundations for buildings, and foundation types. The most common method for maintaining freezing conditions under a building placed on unstable ground is ventilation. Buried foundations such as piles are most suitable since they can be carried below the permafrost table.

44523. DADYKIN, VSEVOLOD PET-ROVICH. Na Krainem Severe. (Nauka i zhizn', Oct. 1956. god 23, no. 10, p. 17-18, illus., col. plate.) Text in Russian. *Title tr.*: In the far North.

Discusses agrobiological methods of investigating the influence of cold soil and permafrost on plant growth. Low soil temperature affects growth chiefly by lowering absorption of nitrogen; foliar feeding by sprinkling leaves with 1-1.5 percent solution of ammonium nitrate increases the crop by 25-30 percent.

Lectures deal with the present status of plant geography in Norway; plant history; physical conditions of plant life; floral elements in the lowland; problems of distribution of native forest trees; mountain flora; problems of distribution of water plants; and effects of humans on plants. Included (p. 82-97) is brief discussion of alpine flora, endemic, west arctic, and (p. 60) eastern zonal relationships, situation with respect to solifluction and polygon soils, localities with richest varieties, etc.

A study based primarily on records of nine weather stations in the valley (Alaska, 61°29' N. 149°16' W.) with an average of about 11 years of records, one with 34 yrs. General geographical and climatic factors are briefly described. Then follows more detailed discussion of precipitation, temperature, evaporation, cloudiness, solar radiation and day length, local winds (including Matanuska and Knik winds and joint occurrence of the two), aeolian soil deposits. Text is supplemented by charts, graphs, and tables of climatic data. Copy seen: DGS.

**44532. DALL, WILLIAM HEALEY, 1845–1927.** Another large Miocene *Scala*. (Nautilus, Dec. 1908. v. 22, no. 8, p. 80–81.)

Epitonium (Acrilla) atwoodi n. sp. from Low Pass Cañon, near Port Moller, Alaska, is described. Opalia rugifera,

Arctoscala condoni and Catenoscala oregonensis were also found in Miocene strata of Alaska Peninsula. Copy seen: DLC.

The problem of ground veins associated with polygonal microrelief is discussed on the basis of investigations in the West Siberian forest tundra. Several scientists have described similar formations as ice wedges, considering them as phenomena associated with ground ice. This Siberian study shows that the formation occurs under other physiographical conditions and is associated with erosional processes or with lithological structure of the ground. The veins were found within sand and gravel soils (cf. cross section p. 112-113) and consisted of sandy loam or The percentage of fine particles increased in the veins with depth. Their location immediately under the sod, extending to a maximum depth of 2.5 m., indicates the independence of these formations from permafrost degradation and melting of fossil ice. Ice deposits found within these veins are seasonal phenomena.-From SIPRE.

Cod have been tagged annually since 1947 on the Lofoten banks during spawning season. Reports on recoveries indicate that the fish migrate toward Bjørnøya and Novaya Zemlya in the Barents Sea, returning toward the Norwegian coast during November and December. Tagging methods and types of tags are evaluated and illustrated. Returned tags, for the years 1947-51, vary 13-40 percent. German, British, Russian, and Norwegian fisherman engage in the catch. Includes (p. 207) brief description of occurrences in the Lovozerskaya Tundra (Kol'skiy Poluostrov; 67°50′ N. 35° E.) where plutonic rocks worked for niobium have interesting quantities of thorium. The rare mineral loparite forms an abundant accessory constituent of a banded nepheline-syenite. The average loparite contains 9%–12% Nb20<sub>8</sub>+Ta<sub>2</sub>O<sub>5</sub>, 40% TiO<sub>2</sub>, 33% rare earths, and 0.6%–0.9% thorium. No recent information is available on experimental plant for extraction of niobium, said to be in operation early in World War II.

Work of the two International Polar Years is reviewed. General program of the IGY. and fields of investigation are stated. The Russian meteorological net of established (292) and new (78) stations is indicated in general terms. Planned oceanographic work is outlined and vessels mentioned. **Copy seen:** DLC.

44559. DAVITAÑA, F. F. The programme of meteorological observations in the Arctic during IGY. (CSAGI Conference . . . pub. in: I. U. G. G. news letter, Sept. 1956. 5° année, no. 15, p. 372–74.)

Observations in the Arctic and sub-Arctic will probably be made from 108 stations including four drifting stations near the North Pole and four weather ships in the North Atlantic. Need is stressed for stations (four specified) in northern Canada, and for organized meteorological observations in Central Greenland. The addition of a uniform observation program of the aurora for all arctic stations is recommended.

44560. DAVYDOV, TÜRIİ VLADIMI-ROVICH. V morâkh i stranstvifâkh. [Izd. 2., perer., dop.] Moskva, Gos. izd-vo geogr. lit-ry, 1956. 207 p. illus., ports., faes., map. 150 refs. Text in Russian. Title tr.: By sea and land. 2d ed. rev. and enl.

Biography of Fedor Fedorovich Matūshkin, 1799–1872, school-friend of the poet Pushkin, sailor and traveler. His two round-the-world voyages to Kamchatka and Alaska, on the Kanchatka under Golovnin in 1817–1819 (p. 19–72), and under Vrangel' on the Krotkit in 1825–1827 (p. 151–56), and his expedition with Vrangel' to northeast Siberia in 1820–1824 (p. 76–132) are included.

44561. DAVYDOV, MITROFAN MI-KHAĬLOVICH. Gidrotekhnicheskoe stroitel'stvo SSSR v pûtof pûtiletke. Moskva, Izd-vo "Znanie," 1954. 40 p. illus., diagrs., maps. (Vsesofûznoe obshchestvo po rasprostraneniû politicheskikh i nauchnykh znanif, serifû 4, no. 13.) Text in Russian. Title tr.: Hydraulic installations of the U. S. S. R. in the fifth five-year plan.

General outline of hydroelectric power development and river transportation in 1951-55. Power potential mainly of the rivers discharging into arctic seas, is discussed and diagrammed (p. 4-6); completion of the hydroelectric station Niva-3 on Kola Peninsula and first steps for harnessing the Angara River are noted. An integrated unified system of river transportation connecting all the bordering seas of European Russia (map p. 22) including White Sea, is discussed.

44563. DAWBIN, W. H. The migrations of humpback whales which pass the New Zealand coast. (Royal Society of New Zealand. Transactions, 1956. v. 84, pt. 1, p. 147–96, illus. tables, maps.) 49 refs.

A study based on 9,000 sightings over North-bound humpback 36 seasons. were found to pass mainly along the east coast, with one group passing through Cook Strait to the west and another along the west coast of the Stewart Island and the southwest coast of the Stewart Island and the southwest coast of South Island. Southward migration is largely along the west coast with some moving along the "sole" and the "heel" of the New Zealand "boot." Seasonal variations in commencing migration, its peak, duration and rate, concentration, spread, etc. are described for selected areas. Of a number of environmental factors considered, such as currents, turbidity, bottom configuration, etc., the orientation of the coastline appeared to be the main modifier of migration routes, which seem to show a trend "towards the northwest and southeast during the northward and southward migration past New Zealand." Copy seen: DLC. DAWSON, DONALD, see Werner, A. Y., and others. Spontaneous rewarming . . . hypothermic . . . dog. 1956. No. 48902.

44564. DAY, E. K. Temperature observations on Fairbanks, Alaska, sewer system. (In: Alaskan Science Conference... 1953. Proceedings, pub. 1956, p. 1–5.)
7 refs.

Soil temperature measurements were made in 1949-50 in test pits around the sewer to obtain data for improving the design of systems in low-temperature areas. The existing sewer system was constructed in 1938-39 following conventional design principles employed in This resulted in conwarmer climates. siderable difficulty from freezing. Sewage temperature was found to follow a general seasonal trend, with the normal lag occurring with ground depth. Sufficient flow data was not obtained for an accurate determination of the effects of sewage flow on freezing but enough evidence was gathered to show the importance of maintaining flow. Calculated values of thermal conductivity of the soils adjacent to the sewers are given. Copy seen: DGS.

44565. DEACON, JOHN. Spartan, Canadian Aero shoran grid north. (Canadian aviation, June 1956. v. 29, no. 6, p. 69, 72, illus., map.)

The use of Shoran to obtain accurate aerial photographic mapping in northern Canada is described briefly. More than half a million sq. mi. have been controlled since 1952, beginning in the Yellowknife area and progressing north along the Mackenzie to the Arctic Islands and east along the coast, including most of the DEW Line. Map shows the area completed 1952-55 and that planned for 1956. Canadian Aero Service Ltd. and Spartan Air Services personnel and aircraft carry out the operations.

Copy seen: DLC.

44566. DEACON, WILFRED. Aluminum in polar exploration. (Light metals, Dec. 1952. v. 15, no. 177, p. 386-89, illus.) 8 refs.

An historical review is presented of some of the uses of Al equipment in polar expeditions. That of the Nansen cooker is traced. The earliest full-scale trial was conducted during the Jackson-Harmsworth expedition to Franz Joseph Land in 1894-97. This party was equipped with two boats, instruments,

cooking apparatus, etc., of aluminum. The experiment was somewhat unsatisfactory, probably due to the high degree of impurity of the Al. Its present successful application to sledges and buildings for arctic use is due mainly to the development of Al alloys. Sledges for the British North Greenland Expedition, 1952–54, are described.

44567. DE ANQUIN, CARLOS E. Congelationes y pie de trinchera. (Revista de la sanidad militar Argentina, 1955. año 54, no. 4, p. 479–83.) Text in Spanish. *Title tr:* Frostbite and trenchfoot.

Contains information on individual and age predispositions to cold injury; pathogenesis; clinical aspects of both kinds of cold injury (symptoms, pathological phases, sequels); prophylaxis, treatment, early and definitive.

Copy seen: DNLM.

44568. DEB, C., and J. S. HART. Hematological and body fluid adjustments during acclimation to a cold environment. (Canadian journal of biochemistry and physiology, Sept. 1956. v. 34, no. 5, p. 959–66, illus., table.) 23 refs.

Account of investigations on rats kept at 6° C. as compared to controls maintained at 30° C. Animals transferred from the warm to the cold environment showed an increase in blood and plasma volume. There was no difference in extracellular fluid volumes between the two groups, nor in erythrocyte count, hemoglobin concentration and plasma specific gravity. There was an increased hematocrit and corpuscular volume and a decreased corpuscular hemoglobin in the cold-adapted rats. Hb, red cells and plasma specific gravity increased with time in both groups. Copy seen: DNLM.

44569. DE BAER, OLIVER. Arctic trawl. (Geographical magazine, Sept. 1956. v. 29, no. 5, p. 250–53, 9 illus., text map.)

Popular account, with illus., of a regular two-week trip of the Grimsby trawler Northern Princess off northern Norway and Bjørnøya, in which writer took part. Ten such trawlers operate out of the British ports of Grimsby and Hull throughout the year. Discomforts and dangers of life aboard ship and the financial compensations are described;

also the actual trawling process, landing the net, gutting and storing the fish.

Contains instructions for physical anthropological field studies: observation, measurement, description, illus., collecting, etc. Need for such studies is stressed, with mention especially of the Indigirka-Yenisey area.

Copy seen: DLC.

44571. DEBETS, GEORGII FRANTSE-VICH, 1905—. DrevniI cherep iz Ākutii. (Akademiā nauk SSSR. Institut ėtnografii. Kratkie soobshcheniā, 1956. no. 25, p. 60–63.) 13 refs. Text in Russian. *Title tr.:* An ancient skull from Yakutia.

Parts of human skeleton and a well-preserved skull together with implements of flint and bone (including mammoth bone) were found in summer 1954 by the geologist G. S. Víazovov. The grave, neolithic, was near Tuoy-Khay village (approx. 62°30′ N. 111° E.) on the right bank of the Chona River, a tributary of the Vilyuy. The skull is mongoloid brachycephalic (measurements given), somewhat different from the present-day Evenki (Tungus), Yakuts and Buryats; it belongs to the so-called Katanga type of Eastern Siberia. Copy seen: DLC.

44572. DE GEER, EBBA HULT. Orographie et glaciation en Amérique du Nord et en Seandinavie. (Cahiers géologiques, July 1956. no. 31, p. 305–316, 3 text maps, diagr. graph.) 21 refs. Text in French. *Title tr.:* Orography and glaciation in North America and in Scandinavia.

A comparison of the effects of the continental ice sheet on the two regions. In Scandinavia, the glaciation was centered on a single chain of mountains; in North America, on a vast plain centering on the Hudson Bay region. Similarity in size and form of the Hudson Bay depression and that of interior Greenland is noted. System of concentric lines indicating glacial retreat in arctic Canada is briefly described; also deglaciation in Alaska, northwest Canada, and the region south of Hudson Bay. Varve method of tracing and dating the glacial margins is considered. Copy seen: DGS.

44576. DEĬNEKO, VIKTOR FILIPPO-VICH. Aérofotogeodezifa. Moskva, Izd-vo geodezicheskol lit-ry, 1955. 423 p., illus., diagrs., graphs, maps. 49 refs. Text in Russian. *Title tr.:* Aerial photogrammetry.

Textbook approved by the Ministry of Higher Education U. S. S. R. for landsurveying courses of agricultural colleges.

Theoretical and practical considerations for aerial survey and preparation of contour photo-plans and maps are systematically presented not only for agricultural purposes, but also for conservation, hydraulic engineering and navigation. Air survey of river banks, lake shores, seacoast, marshes, tundras, etc., is presented as essential for characteristics of localities difficult of access. Uses of air photography are noted for geobotanical studies, in planning drainage of marshland, for study of water run-off and river flow, erosion, drift deposits, form and force of tidal waters, concentration of floating ice, polynyas, etc. Theories and problems in optics, photography (light and exposure) theory of perspective, projective geometry, stereoscopic projection, drafting, etc., are given. Methods and apparatus for analysis, and geometric measurements of recorded photographs are included, especially of the stereoscopic type. Photointerpretation is dealt with (p. 300-312) including factors affecting the photograph. Copy seen: DLC.

44577. de KOCK, L. L. The carotid body of the pilot whale, *Globicephala melaena*. (Nature, June 9, 1956. v. 177, no. 4519, p. 1084–85, illus.) 4 refs.

Contains a macro- and microscopical description based on fresh material secured from stranded animals. The probable physiology of this organ is inferred from its histological structure.

Copy seen: DLC.

44578. De LAGUNA, FREDERICA, 1906— . Chugach prehistory; the archeology of Prince William Sound, Alaska. Seattle, 1956. xix, 289 p. illus., diagrs., maps. (Washington (State) University. Publications in anthropology, v. 13.) 109 refs.

An archeological report on Prince William Sound based on author's 1930 field trip and a joint expedition (1933) with K. Birket-Smith sponsored by the National Museum of Denmark and the University of Pennsylvania Museum (cf. No. 1641 and 2814). The geography, glacial history, geology, flora, fauna, etc., are outlined and the history and distribution of the Chugach Eskimos The 67 archeological sites located on the territory of the eight Chugach tribes (Nuchek, Shallow Water, Sheep Bay, Port Gravina, Tatitlek, Kiniklik, Chenega and Montague Island peoples) are described in turn, mapped, and the cross-sections and plans of the Palugvik midden given. A comparative chronological dating into four periods is suggested: older and younger prehistoric, protohistoric and historic. The skeletal remains and their physical anthropology, burial methods, mummification, use of wooden coffins and fur wrappings, orientation and position of the bodies are dealt with. The rock paintings, pictographs and petroglyphs are reproduced and compared with those found on Cook Inlet, Kodiak Island, etc. The numerous excavated artifacts are described in detail and illustrated: adzes, axes, chisels, saws, picks, scrapers, stone lamps and dishes, knives and blades, awls, pins and needles, harpoon and arrowheads, darts and lances, fish hooks, ornaments, baskets, mattings, sewn skins, wooden canoes and paddles, house posts and stakes, paints, etc. Vital statistics (19th century) are given, the population density compared with that of the Aleuts and Koniags, and an attempt made to reconstruct the material culture and ways of life of the Chugach. The Prince William Sound culture is classed as one of the subareas of the Pacific Eskimo-Aleut complex and its marginal position within the basic cultural pattern common to southwestern Alaska is noted.

44580. de LESSE, HUBERT. Biogéographie des lépidoptères du Groenland. Expéditions polaires françaises, missions P.-É. Victor. Zoologie, 6° note. (Société entomologique de France. Annales, 1952. t. 119, p. 97–116, table, maps.) 31 refs. Text in French. Title tr.: Biogeography of the Lepidoptera of Greenland. Expéditions Polaires Françaises, missions P.-É. Victor. Zoology, 6th note.

Account based on the geographic distribution, relations and in some cases on the ecology of the Greenland butterflies. Of the 36 species recorded, six are common with North America, two with Europe, 22 with both, and six are endemic. A classification according to zones is attempted: southern, central, northern and ubiquitous forms. Hypotheses explaining the geographical distribution and affinities of these butterflies are discussed.

About 600 refs. Text in Russian. *Title* tr.: The helminth fauna of marine mammals in the light of their ecology and phylogeny.

A comprehensive study, claimed to be

he first of its kind for these animals, with author's contribution based on 10-12 years' work and over 1,000 animals examined all over the world, but especially in Russian waters. Introductory sections deal with the aims of the study, material and methods, and earlier studies of these parasites in the Soviet Union. Taxonomy of the trematodes, cestodes, nematodes and Acanthocephala of seals and whales, is treated in the first part (p. 25-366). Discovery, outline of past investigation, anatomy and morphometry, development, host(s) and organs affected, etc. are discussed for each taxis. (p. 369-479) entitled "Helminth fauna and zoogeography" describes these parasites in the various species of seals and turn, their zoogeographic whales in characteristics including the character of those in the arctic (circumpolar) and antarctic regions. Appendices contain tables on distribution of helminths according to hosts and lists of those from seals and whales of Soviet waters.

**44591. DENISON, M. E.,** and **R. L. JASPER.** Glucuronidase activity in liver and kidney from animals exposed to a low environmental temperature. (Federation proceedings, Mar. 1956. v. 15, no. 1, pt. 1, p. 47.)

Summary of a study undertaken to elucidate the sexual dimorphism in survival of rats exposed to cold. Cold exposure of males and of castrated animals decreased the liver glucuronidase activity as well as that in the kidney. These and other reported observations suggest that cold as well as cortisone and testosterone propionate influence glucuronidase activity in the kidney.

Booklet by Rear Admiral F. Kjølsen, first head of this Command, for orientation of servicemen. Introductory sketch is given of Greenland: location, size, population, etc.; of Danish interest in the island from the time of Hans Egede. Unification in 1952, of the former marine and land services into the Greenland Command, also the joint agreement with the American defense group in NATO, are dealt with, the Danish Command supreme even in sections where American troops are located. Greenland's importance in the air age is noted. Suggestions are made for military personnel on attitudes, hobbies, safety measures, hygiene and health, use of leisure time, rules of personal conduct and responsibility, safety restrictions, customs, hunting and fishing regulations, etc.

GRØNLANDS 44594. DENMARK, STYRELSE. Beretning fra den af Sundhedsstyrelsen til Grønland udsendte laegeekspedition 1947-48. København, 1949. 168, p., 6 tables. (*Its*: Beretninger, 1949, no. 1.) Refs. in text. Text in Title tr.: Report of the medical Danish. expedition sent to Greenland by the Ministry of Health, 1947-48. Previously listed as No. 10527.

Basic work, one of the few modern public health surveys published on a large arctic area. It was carried out in West Greenland by Drs. Erik Lynge and Vagn Sindbjerg-Hansen, most of the field work by the latter, and results worked up with aid of Drs. Johs. Holm (tuberculosis), Poul V. Marcussen (venereal diseases), Erik Uhl (technical hygiene), K. Erik Jensen (water supply), and E. Juel Henningsen (epidemic diseases). In nine parts: the first (p. 13-16) outlines itinerary May 1947-June 1948, which covered 90-95 percent of the West Greenland population (settlements listed). U. S. bases (two) and three minor harbors, also Ivigtut and Thule in the north, as well as East Greenland are excluded. Medical personnel are reviewed 17-38), their activities and working conditions; needs are stated for specific trained personnel, and for greater specialization. Health establishments are reported individually and in detail (p. 39-77): 12 hospitals and two children's homes with a total of 348 beds (17.5/1000 population), 70 percent occupied by tubercular patients. A new sanatorium (at Holsteinsborg) and children's hospital (at Julianehaab) are proposed, and needed facilities stated, including X-ray, vaccine, additional doctor boats, some equipped for TB and epidemic service. The TB program is discussed in relation to social and economic conditions: Greenland has the world's highest TB death rate. Other hospitalization is analyzed: surgical, obstetrical, medical, venereal, psychiatric, etc. cases; requirements are stated, including nursing homes, increased obstetrical care, etc. Distribution of medicines and medical supplies is also considered. Pt. 4 (p. 78-133) deals with general hygienic conditions in relation to communities, housing, water supply, including problems of permafrost and winter supply, use of ice; also sewage and rubbish disposal, roadways and drainage. Nutrition and clothing, personal, school, and occupational hygiene. also health education, quarantine, etc.,

A useful summary of conditions reported (p. 134-42) is followed by text of the Aug. 27, 1928 regulations for control of contagious diseases and changes recommended by: Dr. Henningsen on epidemic diseases and quarantine; Dr. Marcussen on venereal diseases; and Dr. Holm on TB (p. 159-68). common means of spreading, actual and reported distribution, also measures for control are stated. Copy seen: DLC.

DENMARK, GRØNLANDS 44595. STYRELSE. Brandværnsinspektion på Grønlands vestkyst 1951-1955. 5 no.: 94, 56, 87, 94, 22 p., illus. (Its: Beretninger vedrørende Grønland, 1951: nr. 2: 1952: nr. 4; 1954; nr. 3; 1954; nr. 5; 1956; nr. 5). Text in Danish. Title tr.: Inspection of fire precautions on the west coast of Greenland 1951-1955. Reports prepared by Berthel Thomasen.

Annual report of investigations of fire precautions and fire risks in various communities in West Greenland, with recommendations for improvements. For earlier information see No. 3863 in Beretninger vedrørende Grønlands styrelse, nr. 4, 1949. File seen: DLC.

DENMARK, GRØNLANDS 44596. STYRELSE. Fortegnelse over udvalgt fag- og skønlitteratur til brug for Grønlands- og grønlandskstuderende danske præster og lærere. København, 1949. 14 p. Text in Danish. *Title tr.:* Catalog of selected scientific and general literature for use by Greenland's Danish clergymen and teachers and those studying for duty in Greenland.

A well-rounded selection of Danish publications on Greenland is listed: periodical articles and books on history, art and music, travels and expeditions, administration, social conditions, folk-lore, church and school, Greenlandic language, fiction.

44600. DENMARK. SØKORTARKI. VET. Dansk fyrliste; fyr- og tågesignalstationer samt radiofyr Danmark, Faerøerne og Grønland, 22. udg. Sluttet den 27. September 1956. København, A/S J. H. Schultz bogtrykkeri, 1956, 321 p., tables, col. map (fold.) Tillaeg nr. 1, Jan. 1957. Text in Danish. Title tr.: Danish lighthouse list; light- and fog-signal stations, with radio beacons, for Denmark, the Faroe Islands, and Greenland, 22nd edition. Corrected to Sept. 27, 1956. Supplement no. 1, Jan. 1957.

List includes lightships, buoys, cable, wreek, and bridge markers, and radio beams. General information is given on navigational aid. Character and use of various lights, their locations, coordinates, appearance, height above water, visibility, tone and radio beam frequencies, variable and group signals, etc., are presented. Contents list in English (p. 14-15) and index of names are included. Greenland light- and fog-signal stations also radio beam air transport signals are given (p. 276-85, 291) and supplement (p. 7-8).

44601. DENMARK. UDENRIGSMINI-STERIET. Greenland. Ringkjøbing, A. Rasmussen, [1956?] 169 p. illus., ports., text maps, diagr.

New edition of No. 32559 and 37858. The chapter on Greenland daily life by V. Borum (p. 89–99) has been rewritten and shortened; and two new chapters have been added: The rational surveying of Greenland, by J. F. Chantelou (p. 153–60) dealing with geodetic surveying between 1927 and 1954; Greenland in the age of technical science, by P. Westphall (p. 161–69) describing shipping activities, Greenland air bases during World War II and their use today, transarctic flights by Scandinavian Airlines System. Other

chapters, reprinted with little or no change are:

Therkilsen, K. J. Greenland, mountain, sea, and ice, p. 9-28.

Contains data (with discussion) from 33 stations covering all Alaska, including inner Aleutians and St. Paul and Gambell Islands in Bering Sea. "Daily maximum temperatures at or below 0° F. may be expected over 50 percent of the days in Jan. at interior stations and extreme northern coastal stations . . . greatest frequency of maximum temperatures at or below -40° F. occurs at Umiat . . Minimum temperatures of -65° F. or less are recorded at only four of the interior stations. July, maximum temperatures at or below 68° F. occur least frequently at interior stations . . . and 75 to 100 percent of the time at stations exposed to maritime influence. Daily minimum temperatures at or below 32° F. in July are rare at all stations south of the Brooks Range. On the Arctic coast, in July, Barter Island and Barrow have freezing temperatures 39 and 41 percent of the time, respectively."-Author's abstract.

de PERCIN, FERNAND. Some 44605. aspects of Quartermaster geographic and climatic research in cold environments. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1806.)

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27-30, 1956, U. S. Quartermaster Corps research began in World War II. Its Arctic Project established 1947, became Cold Environments in 1954. Current program includes preparation of environmental handbooks, studies of climatic analogs, and of microclimate at test sites and other areas; studies of frequency, duration, and distribution of climatic elements.

Copy seen: DGS.

44606. de PERCIN, FERNAND, and S. J. FALKOWSKI. A topoclimatic study, Fort Churchill, Canada. Natick. Mass., Apr. 1956. 28 p. 7 illus., 2 text maps, diagrs., graphs, 3 tables. (U. S. Quartermaster Corps. Environmental Protection Research Division. Technical report EP-38.) 8 refs.

Study was made Jan. 16-Feb. 7, 1955 on local variation of winter temperatures and wind speeds in the Fort Churchill area west of Hudson Bay, as support for Quartermaster Corps tests and as prototype for studies at other test sites. Temperature and wind speed data from five field stations and the main camp are compared. Results indicate that lowest temperatures may be expected in low, snow-covered areas with little or no vegetation; highest temperatures in forests or wooded areas. Strongest winds (and greatest windchill) occur at higher, exposed locations with no obstructions, weakest winds (and least windchill) in areas of dense vegetation and/or in lower sheltered areas. Low temperatures occurred more frequently with light to moderate winds than with calm conditions. There was no correlation between number of hours of sunshine and diurnal temperature range or diurnal wind variation.

44609. de ROMER, HENRY S. The geology of the eastern border of the Labrador Trough, east of Thévenet Lake, New Quebec. (Canadian mining journal, Dec. 1956. v. 77, no. 12, p. 92.) Abstract of unpublished M.Sc. thesis presented to McGill University, 1956.

Area studied is about 30 mi. southwest of Fort Chimo. Intensity of metamorphism increases from west to east; a major structural break separates the highly folded, faulted and overturned eastern part of the Trough from the granitegneiss-migmatite complex to the east; the amphibolites have been derived from former gabbro sills and basalt flows and by metasomatism of dolomitic rocks.

\*\*Copy seen: DGS.\*\*

44610. DERRUAU, MAX. Les formes périglaciaires du Labrador-Ungava central comparées à celles de l'Islande centrale. (Revue de géomorphologie dynamique, Jan.-Feb. 1956. Année 7, no. 1–2, p. 11–16, 5 illus., sketch map, cross-section.) 2 refs. Text in French. Summary in English. Title tr.: Periglacia forms of central Labrador-Ungava compared with those of central Iceland.

Contains results of author's observations in Iceland in 1954 and in the Knob Lake region (54°48' N. 66°48' W.) in Oct. 1955. Climatic and structural conditions are briefly compared. Similarities in relief are: abundance of till and scarcity of rocky outcrops, numerous small convex hilltops, frequency of rock flows, frost pavements, ponds with variable water Major differences are due to levels. underlying bedrock of the two regions (quartzites, schists in Labrador-Ungava; volcanic rocks in Iceland) and to climate. In Labrador-Ungava as opposed to central Iceland, solifluction processes are more active, polygonal soils and ropy peat bogs are common, and ventifacts are scarce. Copy seen: DGS.

44611. DESIGN NEWS. 'Drive-in' skis extend operations of gying automobile. (Design news, Mar. 15, 1956. v. 11, no. 6, p. 4, col. 3, illus.)

Automobile with propeller in rear is

fitted with skis to travel over snow or ice at speeds up to 60 mph.; in the air it cruises at speeds over 100 mph. with cruising range of 300 mi. The car may be backed off the skis, and the latter stored atop the car.

Chap. 5, Primenenie gidromekhanizatsii v zimnikh uslovijakh: Hydraulic operations under winter conditions (p. 309-318) deals with hydraulic excavation and embanking of ground for railroad construction at air temperatures below 0° C. Cohesion increases 2-5 times in frozen ground, requiring higher power consump-Protection from deep freezing is therefore important. A snow cover 20-25 cm. deep provides sufficient protection against ground freezing. Water pipelines in areas of continuous frost should be insulated also, using snow, straw, or other material. Ground freezing at the rate of 15-20 cm./day at air temperatures of -15° to -18° C. does not present any special difficulties in hydraulic operations if the work day is not less than 10-12 hrs. Ground frozen deeper than 1 m. must be prepared for excavation by blasting .-From SIPRE. Copy seen: DLC.

44615. DIAMOND, MARVIN. Precipitation trends in Greenland during the past 30 years. Wilmette, Ill., Dec. 1956. iv, 4 p. diagrs. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. Research report 22.) 6 refs.

Annual precipitation was computed from snow-profile studies made at a test area 200 miles east of Thule, at an elevation of about 6800 ft. An apparent gradual decrease in precipitation between 1920 and 1954 is indicated. A residual mass curve analysis of the data indicates that the largest decrease occurred after 1932 concurrent with the apparent increase in temperature in northern Greenland.

44616. DIAMOND, MARVIN, and R. W. GERDEL. Radiation measurements on the Greenland ice cap. Wilmette, Ill., Oct. 1956. iv, 20 [1] p. illus., diagrs.,

tables (U. S. Army. Corps of Engineers, Snow Ice and Permafrost Research Establishment, Research report 19.) 9 refs.

Global and net radiation measurements were made approximately 200 miles east of Thule near 78° N. lat. during the period July 6-Aug. 7, 1955. Only 15 percent (3059 ly) of the total radiation measured was absorbed by the snow cover, most of which was re-emitted as long-wave radiation. The long-wave radiation balance remained negative. The effects of atmosphere and snow conditions on the radiation as well as possible errors in the radiation measurements are discussed. The hourly values of incident and reflected solar radiation are tabulated.

44617. DIAMOND, MARVIN. Studies on vehicular trafficability of snow, pt. 1. Wilmette, Ill., U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment, April 1956. 24 p. illus., diagrs. tables. (Its: SIPRE report 35) 8 refs. Also reported at Eastern Snow Conference, 13th meeting, Hanover, N. H. vide its Proceedings

(copy at DGS).

"Four light snow vehicles of the personnel-carrier type were used to test the trafficability of the snow cover at the Keweenaw Field Station near Houghton, Mich. in Feb. and Mar. 1955. It was found that the maximum drawbar coefficient was obtained at a track slip of 20-40 percent, indicating that drawbar pull is a function of the frictional resistance of the snow. The Kamm-type, 30°-angle grouser attached to the M-7 tractor produced a significant increase in the drawbar coefficient obtainable. On the basis of an efficiency coefficient, the M-7, with or without angle grousers, outperformed the ladder-type tractor. The maximum efficiency coefficient occurred at lowest track slippage. A modification of Coulomb's equation was shown to express a relationship between tractive effort and vehicle weight. The angle of internal friction varied between 26-32° with a mean of 28°. In these trials the relationship between tractive effort and load appears to be defined by Coulomb's equation for cohesionless materials, indicating that this snow acted as a cohesionless substance when trafficked. An appendix (p. 21-24) by Dr. H. Bader discusses some theoretical considerations on trafficability of snow."-Author's abstract. Copy seen: CaMAI. 44618. DIAMOND, MARVIN, and B. L. HANSEN. Use of a shear vane in snow. Wilmette, Ill., July 1956. iv, 10 p. illus., diagrs., tables. (U. S. Army. Corps of Engineers, Snow Ice and Permafrost Research Establishment. Technical report 40.)

Two shear vanes of different size were used to measure the shear and frictional resistance of snow at various normal pressures. Tests were conducted in Greenland and northern Michigan. The relationship between shear and frictional resistance and normal pressure was found to be linear in 60 percent of the tests and exponential in about 20 percent; there was no apparent relationship in the other 20 percent. Results indicate that instrument size may influence the values obtained. Copy seen: CaMAI.

**44619. DICKIE, FRANCIS.** Branding bison by helicopter. (Frontiers, June 1955. v. 19, no. 5, p. 134–36.)

Wood bison in Wood Buffalo Park (Mackenzie District-Alberta) have increased from about 300 in 1900 to 15,000 in 1954, and further increase is checked by annual thinning to insure food supply. To aid study of migrations within the Park, S5 animals were marked from a helicopter in fall 1954 by spraying with sheep dye; different dye colors indicating animals from different areas. Difficulties experienced by the pilot and Canadian Wildlife Service officer, R. C. Stewart are described.

A preliminary study. made during the 1956 growth season, of range and pasture conditions in primarily stock-raising areas, in contrast with areas of diversified farming, Matanuska and Tanana valleys. Information is offered on the number of cattle, sheep and horses, their feed and graze; vegetation and important forage plants of Umnak Island, their growth and seeding; legumes, poisonous plants, etc. Conditions on Kodiak and southcentral coastal areas, range and meadow managements, cultivated crops, etc., are sketched from a limited sampling. Copy seen: CaMAI.

44622. DIESEL POWER. Cats work in the cold, too. (Diesel power, Aug. 1956. v. 34, no. 8, p. 49, illus.)

The use of Caterpillar equipment on snow and ice during Operation Deepfreeze is noted. The equipment is reported to have performed well in unloading and hauling operations under extreme climatic conditions. The tractors were generally able to haul three Il-ton sleds with a 15-ton payload in third gear.

Copy seen: DLC.

44623. DIESEL POWER. Cold starting made easier. (Diesel power, Sept. 1956. v. 34, no. 9, p. 54-55, illus., diagrs.)

A device designed to provide quick starts of diesel engines at temperatures to  $-70^{\circ}$  F. is described. The device injects starting fluid carburated with air into the intake manifold until regular fuel ignites. The special low etherblend of starting fluid is placed in special capsules. Three types of spray nozzles are described and illustrated.

44627. DILLON, RICHARD H., Editor. Peter Pond and the Overland route to Cook's Inlet. (Pacific Northwest quarterly, Oct. 1951. v. 42, no. 4, p. 324–29.) Ref.

Contains extract of letter from Isaac Ogden (Quebec) to his father David Ogden (London) Nov. 7, 1789. Letter is based on talk with Peter Pond one of the first white men to explore the Great Slave Lake region and on examination of his map. It describes route from Lake Superior to Great Slave Lake and region around the lake and sets forth Pond's opinion that only a narrow stretch of land separated this region from the southern Alaska coast described by Capt. Cook; also that the Slave River emptied into the ocean at Cook Inlet. Editor introduces Ogden's letter, presents a memo from Sir Joseph Banks concerning Pond's travels, and a letter to Banks from J. M. Nooth describing the Great Slave Lake region. *Copy seen:* DGS.

Bd. 164, No. 5, Heft 7, p. 143–60, diagrs., tables.) 16 refs. Text in German. Title tr.: Radiation measurements made on a trip through Norway.

Results of solar and sky radiation measurements made in southern and northern Norway during the period mid-June to beginning August 1952 are presented. Mean values of solar radiation are tabulated for Tromsø (69.6° N. 19.0° E.), Volbu (61.1° N. 9.1° E.) and Spissebu (61.1° N. 9.2° E.) arranged according to solar altitude, and time of day. A comparison of solar radiation intensities reduced to sea level is made with values cited by G. Perl for the same latitudes. The uncertainties and inaccuracies of sky radiation measurements are elaborated. A total of 2000 measurements of sky radiation were obtained and the conclusions drawn are justified on the basis of utilization of identical instruments by the same observer. Intensity values of sky radiation for a cloudless sky according to solar altitudes are tabulated. A comparison is made with results obtained by other authors. It is concluded that high solar radiation and low sky radiation intensities exist in northern and southern Norway.

44645. DONNELS, AL T. Excavations and foundations. [Washington, D. C.] 1956. 2 p. l., 8 p. (In: U. S. Office of Naval Operations. The dynamic North, v. 2, no. 5.)

Large-scale excavation and foundation factors encountered in the construction of airdromes and heavy structures in Alaska are discussed. Particular attention is given to proper engineering methods in permafrost areas. The problems of gravel and rock occurrence in Alaska, drainage, and spoil disposal are considered.

Copy seen: DLC.

44646. DONNELS, ALT. Structures in Alaska. [Washington, D. C.] 1956. 2 p. l., 6 p. (In: U. S. Office of Naval Operations. The dynamic North, v. 2, no. 8.)

Contains a brief climatic description of Alaska and design criteria for docks, warehouses, power plants, storage and repair, also nose hangars, utilidors, fire stations, and storage tanks. The importance of selecting proper earthquake design factors before major construction is noted, and the use of local materials in construction is discussed briefly. Copy seen: DLC.

44647. DONNER, JOAKIM. Istiden. (Finlands natur, 1954. årg. 13, p. 9–16, illus.) Text in Swedish. *Title tr:* The ice age.

The background of bedrock geology and deposits of the last glacial period make Finland an ideal place for study of the ice age. Inorganic and organic investigations contributing to ice age interpretation are explained, and the importance of research in periglacial areas is emphasized. *Copy seen:* DLC.

44648. DONOGHUE, LORRAINE, and C. LUCIER. The University of Alaska Eskimo music and folklore project. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 121–25.) 3 refs.

Music and folklore has been recorded on magnetic tape at Unalakleet, Kotzebue, and other West Alaskan villages, with additional examples from Pt. Hope, Barrow, etc., and Siberia. The Eskimo informants are mostly in the group aged 50-70 years. Some of the material is listed; a few of the songs and their origin are described; a large proportion are pre-Christian, with ritual and religious significance. The music is characterized.

Analysis of both music and songs is still in progress. Copy seen: DGS.

44649. DONOVAN, B. T., and J. J. VAN DER WERFF TEN BOSCH. The cervical sympathetic system and light-induced oestrus in the ferret. (Journal of physiology, Apr. 1956. v. 132, no. 1, p. 123-29, illus.) 19 refs.

Removal of the superior cervical or stellate ganglia produced a marked Horner's syndrome in females, delayed the oestrus response to illumination by reducing the amount of light affecting the retina, but did not affect mating, pregnancy, parturition or lactation after oestrus ensued. Removal of the thyroid did not alter the oestrus response to extra light.

Text in Russian. *Title tr.*: Improvements in timber belts for snow protection. A method of cyclic cutting and planting of trees of different stocks is described for maintaining normal growth and continuous protection against snow drifts. The first row is usually brush wood, the second, locust, elm and apple trees, with oak, maple, pine etc. comprising the rest of the shelter belt. Copy seen: DLC.

44652. DORRESTEIN, R. Bemerkungen zu den Wellenbeobachtungen der Wetterschiffe im östlichen Nordatlantik. (Deutsche hydrographische Zeitschrift, 1955. Bd. 8, Heft 5, p. 177–86, diagrs., tables.) 7 refs. Text in German. Title tr.: Remarks on wave observations by weather ships in the eastern North Atlantic.

Average values and frequency distributions of wave data according to Netherlands observations are compared, on Station A (62° N. 33° W.), with data according to United States observations; on Station J (52° N. 20° W.), with data from British observations; on Station K (45° N. 16° W.), with data from French observations; and on Station M (66° N. 2° E.), with data from Norwegian observations. On each of these stations national differences in the observation of waves are shown to exist. Consequently it is difficult to prove the reality of regional differences between wave data in different parts of the North Atlantic.

44653. DORST, JEAN, 1924— . Les migrations des oiseaux. Paris, Payot, 1956. 419 p., illus, tables, maps. About 400 refs. Text in French. Title tr.: The migrations of birds.

Contains a comprehensive study of the problems, including its variants (e. g. invasions), physiology and evolution. Introductory account of the ancient conceptions on migration (p. 17-27) and of methods of study (p. 28-43), is followed by broad regional treatment. Arctic forms and problems are dealt with in the sections on European and North Asian migrations (p. 44-116) and those of North America (p. 117-34); and they include wild ducks and geese, cranes, the golden plover, etc. The chapter on the migration of marine birds (p. 162-99) includes the arctic tern, petrels, puffins and others. The problem of hibernation in birds is discussed (p. 281-86), and numerous, scattered references to arctic birds are found in subsequent chapters on physiological determinants and "impulsions" of migrations (p. 287-337); problems of orientation (p. 338-90) and the origin and evolution of migration (p. 391-409). References are added to each chapter, and an index of scientific and popular names completes the work. *Copy seen:* DLC.

44657. DREMLŪG, VALENTIN VALENTINOVICH.

zemel' Arktiki. Moskva, Gos. izd-vo geogr. lit-ry, 1956. 44 p. illus., map. 13 refs. Text in Russian. Title tr.: Secret of vanished lands in the Arctic.

Contains account of the "discovery" and the disappearance of so-called hypothetical lands Krest'yanka, Gillis, Zemlya Polyarnikov, Takpuk, Zemlya Andreyeva and Zemlya Sannikova. The disappearance of small islands: Vasil'yevskiy and Semenovskiy is noted also. Ice islands found drifting in the Arctic Basin by Soviet and American fliers are discussed and their origin is explained. The drift of ice in the Basin and explorations of the Soviet drifting stations "North Pole 1-5" are described, after V. F. Burkhanov (No. 33829). Copy seen: DLC.

44658. DREVER, HARALD IRVING, 1912— . The geology of Ubekendt Ejland, West Greenland, part II; the picritic sheets and dykes of the east coast. København, C. A. Reitzel, 1956. 39 p. illus. incl. 31 on 12 plates, diagr., tables. (Meddelelser om Grønland, bd. 137, nr. 4.) 34 refs.

General geology of this island (71°10' N. 53°40' W.), was dealt with in pt. I (Arctic Bibliography, No. 4116), based on work of the Cambridge West Greenland Expedition, 1938, and the St. Andrews University West Greenland Expedition, More data and specimens were 1939.obtained during the British West Greenland Expedition of 1950. Three picritic (olivine-rich basaltic) dikes and four New evidence is sheets were studied. presented on the problem of origin of picritic rocks. Regional setting and local relations of the dikes and sheets, and field and laboratory methods are briefly described. Petrography (with chemical analyses) and petrogenesis of the dike and sheet rocks are discussed in some detail. Copy seen: DGS.

44659. DROBYSHEVSKIĬ, G., and K. MAKAROV. Osobennosti poletov na vertoletakh v slozhnykh meteorologicheskikh usloviñakh. (Grazhdanskaña aviaśiña, July 1956. god 13, no. 7, p. 17–18, illus.) Text in Russian. Title tr.: Peculiarities of helicopter flight in complicated meteorological conditions.

Advice for helicopter pilots, including such on icing. Copy seen: DLC.

44660. DROZDOV, I. Zhizn' v aviatsii. (Grazhdanskafa aviatsifa, Mar. 1956. god. 13, no. 3, p. 8-10, parts.) Text in Russian. Title tr.: Life in aviation. Sketches from the life of aircraft mechanic, Fedor Ivanovich Groshev; his work with the arctic flier M. S. Babushkin in the White Sea area in 1928, and during the search expedition on icebreaker Malygin for Nobile and his companions. Copy seen: DLC.

44661. DRUCKER, PHILIP, 1911— . Archeological survey on the northern Northwest Coast. (U. S. Bureau of American Ethnology. Bulletin 133, Anthropological papers no. 20, pub. 1943, p. 23–132, illus., diagrs., tables, fold. map.) 61 refs.

Presents results of author's survey in 1938 and attempt to integrate published and museum materials. Exploration, trade, native-European contacts, etc., in the 18th-19th centuries are reviewed and the tribal distribution mapped. artifacts (including northern aspect, i. e. Tlingit-Haida-Tsimshian, p. 120-25) are described and tabulated, and the geological provenience horizons graphed. The Tlingit ties to the southwest Alaskan Eskimo cultures are noted and the Tlingit Eskimoid artifacts (barbed bone arrow and harpoon-arrow points, throwingboards, etc.) mentioned.

Contains information on the Arctic Aeromedical Laboratory's survey of Alaskan edible wild plants; compiling a list of them; chemical analysis; field studies on: habitat, distribution, associations, etc.; seasonal distribution; availability; food value and its seasonal changes; value for human survival; poisonous plants resembling edible forms.

Copy seen: DGS.

4464. DRURY, WILLIAM HOLLAND, 1921— . Bog flats and physiographic processes in the upper Kuskokwim River region, Alaska. With suggestions for the origin of certain mucks, an examination of the nature of the local plant associations, and a discussion of the implications as to periglacial climates. Cambridge, Mass., Aug. 1956. 130 p. illus., text maps, diagrs. (Harvard University. Gray Herbarium. Contribution, no. 178.) 135 refs.

Bogs of regional extent which engulf forests and replace them in successional sequence are closely related to geological processes. Physical geography, geological and vegetational aspects of the bogs on the upper Kuskokwim (62°-63°30' N. 154°-156° W.) are summarized on the basis of writer's field work in summers The floodplain, the 1949 and 1950. physiographic processes involved in bog formation and types, the geobotanical processes and sedimentary deposits are described. Vegetation of the flood-plain and bogs, successional sequence, plant associations are presented with comparison of vegetation in Scandinavia. Geological and botanical implications of the studies are discussed, with particular regard to periglacial climate and vegetation during the Pleistocene. Appended are list of bog flora and glossary of terms used in text. Copy seen: DGS.

44665. DRURY, WILLIAM HOLLAND, 1891- . The ecology of the natural origin of a species of *Carex* by hybridization. (Rhodora, Mar. 1956. v. 58, no. 687, p. 51-72, 2 illus.) 6 refs.

Contains English and Latin description of C. paludivagans n. sp. growing on soligenous bogs and bog-invaded ox-bow lakes of the upper Kuskokwim River region of Alaska. The biology of the Carex population in the region, which seems to be of hybrid origin, indicates that it has reached species status, because it fruits abundantly over a wide area and maintains its identity both in presence and absence of the suggested parental species, C. rotundata and C. rostrata. Tabulation of characteristics of these species, character index and tabulation of characters in different habitats are given. These data prove that there is a uniform and fertile population of C. paludivagans which is more abundant and widespread than both parents, and the author is convinced that this constitutes a species. Copy seen: DA.

44668. DUBININ, V. B. Paukoobraznye, t. 6, vyp. 7; per'evye kleshchi. Analgesoidea, ch. 3, semelstvo Pterolichidae. Moskva-Leningrad, Izd-vo Akadnauk SSSR, 1956. 813 p. 398 illus. (In: Fauna SSSR. Arachnidea, t. 6, vyp. 7 (nov. ser. no. 63).) 403 refs. Text in Russian. Title tr.: Arachnids: the feather mites. Analgesoidea, pt. 3, family Pterolichidae.

Contains a systematic index of the species, characteristics of the family, tables for the determination of the subfamilies, genera and species. Some 122 species are described, eight and one subspecies as new. Synonyms are given; taxonomy, morphology, biology and ecology are considered for each species; and geographic distribution shown on numerous text maps. For the economically important species, additional data are supplied on pathogenic importance, hosts (birds), life cycle, also methods of control and prophylaxis. Many species native to northern regions of the U.S.S.R. are included. Alphabetic indexes of the feather mites and the (host) birds are appended. Parts 1 and 2 of this work were listed previously as No. 28822 and Copy seen: DIC No. 28823.

44669. DUBNITSKIĬ, A. A. Puti zarazheniâ pestsov untsinariozom. (Karakulevodstvo i zverovodstvo, Sept.—Oct. 1956. god 9, no. 5, p. 45–46.) Text in Russian. *Title tr.:* Ways of infection with uncinariasis in arctic foxes.

Report on experiments and observations concerning infection with Uncinaria
stenocephala. Invasion was found to take
place by ingestion of the larval stages
found in food or water; within two weeks
the larvae are fully developed. The
same parasite infects red foxes and
preventive measures are identical in both
species.

Describes and maps ice conditions encountered in Norwegian Bay (southern Ellesmere), Jones Sound, Lancaster Sound, the Resolute Bay region, Baffin Bay, Davis Strait, Hudson Bay and Strait, and Foxe Basin. Writer spent Aug. 13–22 on the C. D. Howe and Aug. 22–Sept. 19 on the d'Iberville during Operation NORS-II (resupply of arctic stations) and accompanied C. D. Howe to DEW-Line site 30 in Foxe Basin Sept. 19–Oct. 12. Ice reporting system of the U. S. Hydrographic Office is used. Copy seen: CaMAI.

44686. DUNKLE, ROBERT V., and J. T. BEVANS. An approximate analysis of the solar reflectance and transmittance of a snow cover. (Journal of meteorology, Apr. 1956. v. 13, no. 2, p. 212-16,

graph, tables.) 11 refs.

"An analysis was made of the transmission and reflection of a mathematical model approximating a snow cover. The intent of the analysis was to obtain a more reliable picture of the factors influencing the albedo and the energy absorbed. The general case of a slab of finite thickness, irradiated from both sides, is solved and reduced to the case of a semi-infinite slab irradiated from one direction. Reflectance of a snow cover is fairly constant in the visible region but drops rapidly in the infrared region due to the increase in the absorption coefficient with wavelength. Additional data are required on radiation transmission in snow with different structural characteristics, on the correlation of transmittance with snow structure, and on the spectral reflectance of snow."-SIPRE.

The area around Nasafjäll is a gap through the Koli complex of Cambro-Ordovician rocks in the middle of the Scandinavian Caledonian mountains. It is in Sweden (mainly) and Norway, on both sides of the Arctic Circle. The entire gap shows a complex of flat-lying nappes, the lowest member of which, tectonically and stratigraphically, is the Nasafjäll massif, a granite complex of more or less schistose lamellae, and the granite of Krokstrandsnäset, southeast of Nasafjäll on the Norwegian side. Quartz dikes that cut the granite and contain ore are younger than the overthrust Kolicomplex. Copy seen: DGS.

44688. DURLING, G. En bestigning af Kebnekaise. (Svenska turistföreningen, Stockholm. Årsskrift, 1896, p. 278–94.) Text in Swedish. *Title tr.:* A Kebnekaise climb.

Reports an ascent starting from Sjømdalen, Norway, with two Lapps who had accompanied Charles Rabot, on the second expedition up Kebnekaise thirteen years earlier; snow and ice covering the peak in midsummer made climbing difficult. Describes in detail, the landscape of a little reported section of Norway and Sweden northwest of Kebnekaise.

44692. DU VERNET, J. P. An airborne magnetometer survey in the arctic islands. (Canadian mining journal, Mar. 1956. v. 77, no. 3, p. 57-59, illus.)

e - 1

p e e n e s r

Contains general description of the airborne magnetometer and scintillation counter survey (Geological Survey of Canada) in the Queen Elizabeth Islands, June 1955, a supplement to the helicopterground geological reconnaissance of "Operation Franklin." Resolute Bay, on Cornwallis Island was used as base for the Canso aircraft. Navigation problems, the flight Ottawa-Churchill-Resolute, survey flights, and weather condi-

tions are described. Scientific results are not given. Copy seen: DGS.

44693. DUZHKIN, N., and A. LIBER-MAN. Okonnye korobki iz legkogo betona. (Arkhitektura i stroitel'stvo Moskvy, Oct. 1956, god 5, no. 10, p. 31–32, illus., diagr.) Text in Russian. *Title tr:* Window frames of light-weight concrete.

Describes construction of concrete window frames and climatic room tests to determine their strength and thermal resistance under freezing conditions. Tests were conducted for 16 days at temperatures of  $-20^{\circ}$  C. outside the frame and +18° C. inside. The light-weight concrete ("thermal concrete") is com-posed of one part cement, four parts pine sawdust and 1.7 parts water; it was steam-treated for 16 hrs. at 70-80° C. Its strength, initially 60 kg./cm.2 increased in two months to 80 kg./cm.2 In addition to its high frost and heat resistance, "thermal concrete" has the specific ability to hold nails and screws without wooden plugs. Setting of this frame in the building wall with wooden sash glazed and fittings is diagrammed Copy seen: DLC. (fig. 4.).

44694. DYAR, HARRISON GRAY, 1866-1929, and R. C. SHANNON. The mosquitoes of Peary's North Pole expedition of 1908. (Washington Academy of Sciences. Journal, Feb. 19, 1925. v. 15, no. 4, p. 77-78.)

Contains descriptions of Aëdes pearyi and A. labradorensis n. spp. from Hawk's Harbour, Labrador; also notes on two other species, including A. alpinus from Godhavn, and Holstenborg, Greenland.

Copy seen: DLC.

44695. DYAR, HARRISON GRAY, 1866-1929. The mosquitoes of the United States. (U. S. National Museum, Proceedings, June 28, 1922. v. 62, art. 1, no. 2447, p. 1-119.)

Contains a discussion of mosquito fauna of the region "between the Canadian and Mexican boundaries, including southern Florida and Alaska," and its subdivisions; keys to the tribes, genera and species are followed by a systematic list of about 150, with brief descriptions, synonyms, U. S. records and data on general distribution. About twenty species are recorded in Alaska.

Copy seen: DLC.

44696. DYAR, HARRISON GRAY, 1866–1929. Notes on Alaskan Arctiidae. (Entomological news, May 1899. v. 10,

no. 5, p. 130-31.)

Contains description of Hyphoraia subnebulosa n. sp. (Nushagak, Point Barrow and Bethel), also critical notes and distributional data on five other species from Alaska. Copy seen: DA.

44704. EAKIN, HENRY MINER, 1883-1936. The conditions of "antiplanation" in sub-arctic regions. (Washington Academy of Sciences. Journal, Apr. 4, 1914. v. 4, no. 7, p. 171.)

Contains a discussion of the flat-topped accumulation of loose rock which is a topographic feature in central and western Alaska: flat-topped hills, ridges, passes and terrace-like forms, etc. They are results of the action of morphologic process distinct from the processes of aqueous erosion. The process is termed "antiplanation," a specific process that is active in forming high level flats and plains.

Copy seen: DLC.

44705. EAKIN, HENRY MINER, 1883–1936. The Quaternary history of central Alaska. (Washington Academy of Sciencies. Journal, Feb. 4, 1917. v. 7, no. 3, p. 81.)

Central Alaska is divided between uplands formed by solid rocks, and a number of basins floored with Quaternary sediments that head far inland. In Quaternary time the normal drainage outlets were temporarily dammed, large areas were inundated and silted up, new outlets through low passes in the rims of old basins were formed, and the drainage of the whole region was reorganized. Various hypotheses as to the nature of the dams were considered.

Copy seen: DLC.

44706. EAKIN, HENRY MINER, 1883–1936. Quaternary problems of central Alaska. (Washington Academy of Sciences. Journal, May 19, 1913. v. 3, no. 10, p. 301–302.)

Contains a discussion of topographic irregularities of river valleys developed in part at least, in Quaternary time. The drainage then had little resemblance

in arrangement to that of today. "The hypothesis advanced involves the ponding of water in the old drainage basin by glacial obstruction: the establishment of drainage lines across the lowest available divides; and the topographic adjustment of the present river systems."

Copy seen: DLC.

**44707. EAKIN, TERRY C.** Armor in the Arctic. (Armor, Sept.-Oct. 1956. v. 65, no. 5, p. 28-29, illus.)

A brief account is given of the performance of military tanks during Exereise Moose Horn conducted in the Big Delta area of Alaska during Jan.-Feb. The maneuver required the units to move some thousand miles in two weeks at temperatures mostly below Engines and weapons performed satisfactorily. Some difficulty was experienced in protecting crewmen from the cold and some complaints were voiced that arctic clothing, as now issued, is too bulky for tank personnel. The Exercise demonstrated that a tank company can haul an infantry battalion's supplies over snow in 2-ton sleds and can travel long distances in the Alaskan winter without losing fighting ability.

**44724. EDHOLM, OTTO GUSTAF, 1909** . Physiology in the polar regions. (Nature, Nov. 3, 1956. v. 178, no. 4540, p. 954–56.)

Contains a review and discussions of the main problems brought up at the "polar physiology" session (Sept. 4, 1956) of the British Association for the Advancement of Science. Included are cold acclimatization, sleep duration and habits during the long day and night; diurnal physiological rhythms; food intake, energy expenditure and general metabolism in man and in sled dogs; physiological apparatus and methods suitable for expeditions.

EDHOLM, OTTO GUSTAF, 1909—, see also Pugh, L. G. C. E., and O. G. Edholm. The physiology of survival . . . cold water. 1956. No. 47474.

44725. EDMONDSON, WALLES THOMAS, 1916- . The relation of photosynthesis by phytoplankton to light in lakes. (Ecology, Jan. 1956. v. 37, no. 1, 161-74, illus.) 58 refs.

Contains a theoretical study based on measurements of the rate of photosynthesis in planktonic algae as function of light intensity and of its penetration into water. Observations and data obtained on Bare Lake, Kodiak Island, Alaska were utilized. Conclusions as to regional, geographic and seasonal variations in photosynthesis and ultimately in productivity are drawn in general terms. The

significance of other factors such as nutrients and temperature for productivity of both the phytoplankton and rooted plants, are also considered.

Copy seen: DLC.

44726. EDSMAN, CARL MARTIN. The story of the bear wife in nordic tradition. (Ethnos, 1956. v. 21, no. 1-2, p. 36-53.) 55 refs.

Discusses the bear myths of North America and northern Eurasia, comparing them with Scandinavian legends. An 18th century bear ceremonial is retold (p. 47-48); a relationship between the Lappish, Finnish and other circumpolar bear festivals and tales is suggested. A bear myth tradition found in certain rituals and marriage rites of Finland and Sweden is noted. Copy seen: DLC.

44727. EDSON, QUENTIN A. Preliminary report on the Alaska sablefish fishery. (In: Alaskan Science Conference . . 1953. Proceedings, pub. 1956, p. 76.)

Investigations indicate the existence of local stocks of this fish, at least in the inside waters. Fishing activities caused an initial decline of catch in all areas followed by a period of stabilization. Suggestions for size limitations are presented.

Copy seen: DGS.

44728. EDSTRÖM, EINAR. Gränslandet. Stockholm, LTs förlag, 1953. 204 p. Text in Swedish. Title tr.: Border country.

Three sketches in popular style, dealing with Finland as a borderland between East and West. The characters delineated exemplify various segments of the population, their common loyalty is stressed. The second sketch is impressions from a trip in Lapland, with numerous geographic references and discussion of the need and operation of the eastern border patrol.

44729. EDWARDS, EVERETT JOSHUA, 1871–1950, and J. E. RATTRAY. Whale off. The story of American shore whaling. New York, Coward-McCann, 1956. 285 p. illus., map. First pub. 1932.

Contains in pt. 1 (p. 3-171) a biographical and character sketch of the senior author's father "Cap'n Josh" B. Edwards (1830-1915), his crew, whaling activities and methods, etc. Pt. 2 (p. 175-278) written by the junior author deals with

American shore whaling, particularly that practiced off the eastern end of Long Island from 1640 to 1918. The role of women in whaling is dealt with (p. 231–34); and a vocabulary of nautical and local terms is included.

Aboriginal music and crafts are noted; introduction of Russian folk songs by 19th century political exiles is outlined, and account given of the artistic achievements under Soviet guidance: creation of the first Yakut theatrical troupe in 1925 and the national Yakut theatre in 1930; a Yakut choral group in 1936 and the musical-choreographic school in 1945; the museum of pictorial art in 1946, etc. Copy seen: DLC.

44734. EFREMOV, S. D. Rafsionalizafsifa pri snegos"emkakh. (Meteorologifa i gidrologifa, Jan. 1953, no. 1, p. 58, diagr.) Text in Russian. *Title tr.*: An improvement in snow surveys.

Methods of measuring the density of deep snow are given, and several simple devices for transporting and measuring

equipment are described.

Copy seen: DLC (microfilm.)

44735. EGDAHL, RICHARD H., and J. B. RICHARDS. Effect of extreme cold exposure on adrenocortical function in the unanesthetized dog. (American journal of physiology, May 1956. v. 185, no. 2, p. 239-42, table.) 13 refs.

Account of experiments with dogs exposed to temperatures of —46° to –50° C. and of —75 to —79° C. In both groups a marked increase in adrenal steroid output, lasting 1–3 hrs. after commencement of exposure, occurred. Administration of ACTH produced a sub-segment rise in adrenal 17-hydroxy-corticosteroid output after it returned to normal. Copy seen: DLC.

44736. EGDAHL, RICHARD H., and others. Tolerance of the dog to extreme cold exposure. (Naval Medical Research Institute. Research report, 6 May 1956. v. 14, p. 389–94, table. Project NM 007 081.22.10.) 5 refs. Other authors: D. M. Hume and J. B. Richards.

Sixteen out of 17 dogs exposed to temperatures of  $-46^\circ$  to  $-50^\circ$  and  $-76^\circ$  to  $-80^\circ$  C. for 3–27 hrs. showed no ill effects and a virtually constant rectal temperature. Two adrenalectomized dogs withstood  $-46^\circ$  to  $-50^\circ$  C. for 4.5 hrs. and one withstood  $-5^\circ$  C. for 8 hrs. without adverse effects and in a similar way as non-operated controls withstood.

Text in Russian. Summary in English. Other authors: Ü. N. Kashmenskii and P. V. Ponomarev. Title tr.: Changes in function of the cardiovascular and renal systems during hypothermia.

A study of 30 patients operated for pulmonary diseases while under moderate hypothermia (34°–29° C.). Conditions were also studied before and during operation and hypothermia, and at two stages after them. The following factors were recorded: clinical condition, arterial blood pressure, heart volume, general peripheral circulatory resistance and ECG; further: urine composition, glomerular filtration and tubular reabsorption, renal circulation and diuresis. Cardio-vascular and kidney changes were less pronounced at 33°–34° C. than at 32° C. and below.

44739. EGOROVA, A. A. Mikrobiologicheskoe issledovanie vozdukha, snega i l'da Karskogo morfa. (Mikrobiologifa, 1940. t. 9, vyp. 9–10, p. 888–94, tables.) 7 refs. Text in Russian. Summary in English. *Title tr.:* Microbiological study of air, snow and ice in Kara Sea.

Contains an outline of microbiological research of the arctic environment since 1864, followed by information on the methods of the present study organized by the Arctic Institute of the U. S. S. R. and conducted during 1930–1935. Air was found to be practically sterile, except when off-land winds carry soil particles. Mainland, old, snow contained more microbes than snow on the ice offshore. The younger the ice, the more germs it contained, including marine forms.

44740. EHRLICH, PAUL R. Ecological observations on Erebia (Lepidoptera: Satyridae) in northwestern America. (Entomological news, Feb. 1956. v. 67, no. 2, p. 29–36.) 6 refs. "Contrib. No. 912 from Dept. of Entom. Univ. of Kansas, Lawrence."

Contains ecological notes on eight species, based on survey conducted in 1955 in northern British Columbia, southwestern Yukon Territory and eastcentral Alaska. Specifically the localities studied were along the Alaska, Steese and Taylor Highways, the Denali Highway in Mt. McKinley National Park, and the Dawson Road, running from the Taylor Highway in Alaska to Dawson, Yukon Territory. E. fasciata was the one species which appeared to be largely restricted to a true "arctic habitat." It was found in moist grassy tundra stations, above the tree line. In no case was it found in open areas within forest growth. E. rossii, popularly pictured as an arctic butterfly, was found to thrive in the taiga as well as in the tundra. Copy seen: DA.

44741. EHRLICH, PAUL R. A new subspecies of *Erebia epipsodea* Butler; Lepidoptera: Satyridae. (Entomological news, Nov. 1952. v. 63, no. 9, p. 225–31.) 9 refs.

Contains a full description of Erebia epipsodea ssp. remingtoni, n. spp., collected in the summer of 1950, by P. S. Remington along the Alaska Highway in northern British Columbia, southern Yukon Territory and Alaska (Ft. Yukon).

Copy seen: DA.

44742. EICHER, GEORGE J. Differential productivity of Bristol Bay red salmon spawning grounds. (*In:* Alaskan Science Conference . . . 1953. Proceedings, pub. 1956, p. 69–72.)

Contains a discussion of factors which make for persistent high yields (productivity) of certain spawning areas. Relevant conditions, and past work on ascertaining productivity are described for Bristol Bay spawning grounds. Further lines of research and improvements to increase the initial production of fry of red salmon, are suggested.

Copy seen: DGS.

44749. EISEMAN, B., and others. Prolonged hypothermia in experimental pneumecoccal peritonitis. (Journal of clinical investigation, Sept. 1956. v. 35, no. 9, p. 940–46, illus., tables.) 18 refs. Other authors: W. G. Malette, R. S. Wotkyns, W. B. Summers and J. L. Tong.

A description of the effect of hypothermia (19° C.) on mice with type III pneumococcal peritonitis. A longer survival was observed in the hypothermic animals; this was greater than can be accounted for by inhibition of bacterial growth during the period of hypothermia. An explanation of this condition is suggested.

44759. ELDORADO MINING AND REFINING LTD. The Eldorado enter-(Canadian Institute of Mining Metallurgy. Transactions, v. 49, p. 423–38.) 2 refs.

A three-part paper. The discovery, exploration, and development of the Eldorado uranium property on Great Bear Lake are described by members of the Company staff. Lithology and structure of the mine area, mineralogy of the pitchblende deposits, alteration of rocks and veins in the mine area, factors controlling ore deposition, and source of the ore solutions are dealt with by R. Murphy. Gravity milling operations from their start in 1933 to 1946 are described by H. M. Howard. Copy seen: DGS.

44760. ELDRIDGE, ARTHUR C. A numerical method of forecasting summer precipitation in the area of Elmendorf Air Force Base. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 117-19.)

A number of objective meteorological variables are combined by graphical correlation techniques, and the results are presented in terms of the probability of rainfall accurring in each of several "amount" categories. The method was first tested in the summer of 1951, using data for the summers of 1949 and 1950, and later extended to the summer of 1952, using the previous three years' data. The purely persistence forecast was 75 percent correct. Copy seen: DGS.

Pine wood samples, saturated in water and dried to different degree of moisture (18, 30, 60, and 100 percent) were frozen for ten days at temperatures: -10° -25° and -40° C. before the impact bending tests. The test data are tabulated and graphically represented in two and three dimensional relations: impact load—temperature—moisture.

44764. ELLIOTT, FRANCIS EDWARD, 1909— . Some factors affecting the extent of ice in the Barents Sea area. (Arctic, 1956. v. 9, no. 4, p. 249-57, text map, graph, 2 tables.) 17 refs.

Variations in flow of the Gulf Stream system and in transport of warm Atlantic water across the Wyville-Thomson Ridge northeastwards (via the North Cape Current) affect the areal extent of ice in the Barents Sea. Theoretical considerations and data are presented relating variations in the Florida Current (southern Gulf Stream system), as indicated by mean sea level changes at Charleston, S. C., and Miami, Fla., to ice conditions in the Barents Sea three years later. Low sea level at Charleston and Miami means strong flow of the Florida Current. contraction of the North Atlantic eddy, little warm Atlantic surface water discharged into the Barents Sea and thus more ice. Conversely, high sea level at Charleston and Miami results in more Atlantic water in Barents Sea and less ice. Relationship of ice to winds in Barents Sea area is also briefly discussed. In the period 1925-1938, good agreement between sea level, ice, and wind curves occurs in 12 of the 14 years.

44765. ELLIOTT, GRAHAM F. On Tertiary transarctic brachiopod migration. (Annals and magazine of natural history, Apr. 1956. series 12, v. 9, no. 100, p. 280-86, text map.) 23 refs.

Recent and fossil distribution of six brachiopod genera in the Arctic Basin, North Atlantic and North Pacific is discussed. Hemithyris psittacea (Gmelin) migrated from Pacific to Atlantic through the Canadian Arctic in the Pleistocene, and Glaciarcula gen. nov., from the Atlantic to Pacific by the same route in the Pleistocene or later. Both are coldwater forms. Dallina, Japanithyris and Macandrevia probably migrated from Pacific to Atlantic in early Pliocene, via the Arctic or Central America. Tegulorhynchia is not a transarctic brachiopod. Appended is a systematic description of Glaciarcula, gen. nov.

Description of a case in a woman of 21, being the fifth case reported in an adult. The patient had ingested daily 160,000-180,000 unit of vitamin A for over seven months in a program of self-medication. Symptoms and signs of the disease disappeared promptly after discontinuation of the vitamin. Copy seen: DNLM.

44767. ELLIS, D. V. Observations on the migration, distribution and breeding of birds in the Canadian Arctic during 1954 and 1955. (Dansk ornithologisk forening. Tidsskrift, Oct. 1956. Årg. 50, hefte 3, p. 207-229, 4 illus., text map.) 13 refs. Summary in Danish.

Contains observations made from May 1954 to Aug. 1955 between Coppermine and Pond Inlet. An annotated list of 60 species, giving the date, number of birds and direction of flight is provided; the observations are summarized to indicate the dates of arrival of the birds, their breeding periods, and their departure (tables 1–3). Distribution of birds observed in 1954 and 1955 (cf. text map) is also tabulated. Copy seen: DA.

Some difficulties in interpreting results of pollen analyses in upper Norrland are due to the fact that there are fewer climate-connoting forest elements. This handicap was met by devising a means to distinguish between the pollen of different species of birch. Examinations of fossil materials from Kiruna, Masugnsbyn, at Junosuando, and Kuouka, all above the Arctic Circle, are illustrated and discussed. Methods of procedure are discussed in great detail. Copy seen: DGS.

**ÈNGEL', P. S.**, see Veselkin, N. V., and others. O vliîanii sveta . . . 1934. No. 48729.

44783. ENGELHARDT, GEORGE PAUL, 1871–1942. The North American clear-wing moths of the family Aegeriidae. Washington, D. C., 1946. vi, 222 p., 32 plates. (U. S. National Museum. Bulletin 190.) A posthumous publication, prepared by A. Busck, with a foreword by C. Heinrich.

The family is defined and classification given. A systematic list of about 160 species is presented with full keys, synonyms, descriptions, also data on habitats, food plants and distribution. Seven genera and about 35 species, varieties, races and forms are described as new. At least seven species are native to Alaska and northern Canada.

Copy seen: DLC.

44784. ENGELS, WILLIAM LOUIS, 1905—, and C. E. JENNER. The effect of temperature on testicular recrudescence in juncos at different photoperiods. (Biological bulletin, Apr. 1956. v. 110, no. 2, p. 129–37, tables.) 13 refs.

Contains a study on the effects of temperature and day-length at near natural levels and at the time of normal recrudescence. Low temperature was found to retard recrudescence, higher temperatures accelerate it. Day-length is "in some way" part of the recrudescence mechanism, "being either permissive or prohibitive of sperm development above or below approximately 11 hours, temperature having here only a modifying role." The existence of a critical, minimum length of day was not conclusively demonstrated nor disproved.

Copy seen: DLC.

**44785.** *ENGINEER*. Ice locomotives. (Engineer, Jan. 27, 1956. v. 201, no. 5218, p. 130–31, illus.)

Contains description and illustration of locomotives designed in 1861 in England and sent to Moscow for use on frozen rivers and lakes.

Copy seen: DLC.

44786. ENGINEERING JOURNAL.
The energy resources of Canada. (Engineering journal, Dec. 1956. v. 39, no. 12, p. 1678–84, 1696, chart, tables.)

Progress in the development of the energy resources is discussed. Sources of energy in Canada are charted for the period 1927–1955, showing the relative contribution of imported and domestic petroleum, natural gas, water power, and imported and domestic coal. Imported coal provided the largest single energy source through most of this period but has now been replaced by domestic petroleum. Future energy requirements and possible sources are discussed.

Contains a study of solar urticaria (urticaria photogenica) with information on onset, clinical aspects, course and prognosis; experimental studies and their results; photo allergy; allergic nature of solar urticaria; therapy.

Copy seen: DNLM.

44788. ERÄMETSÄ, OLAVI. Zinkgehalte finnischer Minerale mit nichtmetallischem Charakter. Helsinki, 1945. 12 p. (Suomalainen tiedeakatemia. Toimituksia. Sarja A-II, chemica, 14.) 6 refs. Text in German. *Title tr.:* Zinccontaining minerals of a non-metallic character in Finland.

Spectrographic analysis of minerals from many localities in Finland, including some in the Arctic, reveals zinc content in non-metallic minerals. Occurrence, mineral content, and mineralogic problems are considered. Copy seen: DGS.

44789. EREMEEVA, K. M. Sezonnye izmenenifa kozhnogo i volosfanogo pokrovov golubykh pesfsov. (Karakulevodstvo i zverovodstvo, Jan.-Feb. 1956. god 9, no. 1, p. 38–40, illus., tables.) Text in Russian. Title tr.: Seasonal changes of the skin and hair-cover of blue foxes.

Biopsy samples of skin and hair samples

were studied monthly in ten animals. It was found that they moult twice a year, in spring and fall. The summer hair-cover is fully developed in August; that of the winter, in December. Changes in the skin were closely related to changes in the hair-cover. Copy seen: DLC.

**44790. ERIKSON, HARALD.** The body temperature of arctic ground squirrels (*Citellus parryi*) at varying environmental temperature. (Acta physiologica scandinavica, 1956. v. 36, fasc.

1-2, p. 75-78, illus.) 2 refs.

Unrestrained animals showed a body temperature of 36.5° to 39° C. at environmental temperature range of +30° to -30° C. At +38° C., a marked increase of body temperature (to about 41° C.) took place; restraint lowered the tolerance to cold, but only slightly to heat.

Copy seen: DNLM.

44791. ERIKSON, HARALD, and others. The critical temperature in naked man. (Acta physiologica scandinavica, 1956. v. 37, fasc. 1, p. 35–39, illus.) 13 refs. Other authors: J. Krog, K. L. Andersen, and P. F. Scholander.

Account of experiments on a bicycle ergometer in a cold room, with the subjects doing just enough work to avoid becoming cold. Critical temperature was found to be about 26° C.; below this point heat production increased approximately in proportion to the body-to-air temperature gradient, in conformity with Newton's law of cooling.

Copy seen: DNLM.

44792. ERIKSON, HARALD. Observations of the body temperature of arctic ground squirrels (Citellus parryi) during hibernation. (Acta physiologica scandinavica, 1956. v. 36, fasc. 1-2, p. 79-81, illus.) 2 refs.

In animals kept at around  $0^{\circ}$  C., body temperature was only slightly higher than that of environment. Drop of ambient temperature to  $-10^{\circ}$  C., noise, or even moderate handling caused rise in body

temperature and waking up.

Copy seen: DNLM.

44793. ERIKSON, HARALD. Observations on the metabolism of arctic ground squirrels (Citellus parryi) at different environmental temperatures. (Acta physiologica scandinavica, 1956. v. 36, fasc. 1-2, p. 66-74, illus., tables.) 3 refs.

The metabolic rate of these animals was "found to be of the same magnitude as common in mammals." During sleep at night there was a reduction of about 50 percent of daytime values. Temperatures from  $-30^{\circ}$  to  $+40^{\circ}$  C. were well tolerated;  $+50^{\circ}$  C. caused death after one hour. Metabolic rate and activity increased below  $+10^{\circ}$  C. Metabolism, following feeding at various ambient temperatures and seasons, is also discussed. This and two of the studies above were made at the Arctic Research Laboratory, Point Barrow, Alaska, under contract with the U. S. Office of Naval Research.

44794. ERIKSSON, J. V. Isläggning och islossning i Sveriges insjöar. Uppsala, Almquist & Wiksell, 1920. 2 p. 1., 95 p. diagrs., maps, tables. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, bd. 1, no. 2.) 44 refs. Text in Swedish. Summary in French. Title tr.: Ice cover and break-up in Sweden's inland lakes.

Study based on observations (15138) of 1864 lakes in Sweden during 1870-The effect of meteorological, hydrological and geographic-topographical factors upon the formation, duration and break-up of ice is traced. An isochronal map based on the mean annual freezing time shows that freezing begins in the inland area of Lapland 90 days, in central Sweden 40 days, and in the southern part 20 days before Jan. 1. Ice thickness varies greatly from year to year depending on the temperature, length of winter, and amount of precipitation. Break-up time ranges from 80 days after Jan. 1 in the south to 160 days on the northwest coast. Isochronal maps showing the mean freezing and break-up amplitudes throughout the country are presented. Climatic periodicities of 2, 4-5, 8, 11 and 25 years are evident from this study. Copy seen: DWB.

44795. ERIKSSON, J. V. Den kemiska denudationen i Sverige. Stockholm, 1929. 96 p. illus., maps, tables. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, bd. 5, no. 3.) 69 refs. Text in Swedish. Summary in French. Title tr.: Chemical denudation in Sweden.

Contains data from an extensive study conducted during 1909–1925 on dissolved material and that carried in suspension in Swedish rivers. Special equipment for making these measurements at the surface and at various depths, and methods of the chemical analyses are described

briefly. The analyses are tabulated for each station (including several on the Torne, Kalix, Lule and Pite Rivers in the far North), and summarized. Measurements included inorganic material, amount of calcium oxide or magnesium oxide, degree of water hardness, alkalinity, pH concentration; free and semicombined carbonic acid, organic material, periodicity in the appearance of dissolved materials, and absolute quantities of dissolved materials. The geographical significance of chemical denudation is discussed.

ERKAMO, 44796. VILHO. Untersuchungen über die pflanzenbiologischen und einige andere Folgeerscheinungen der neuzeitlichen Klimaschwankung in Finnland. Helsinki, 1956. xii, 290 p. 55 illus. (incl. 43 text maps) 29 tables. (Suomalainen eläin- ja kasvitieteellinen seura Vanamo, Kasvitieteellisiä julkaisuja, 1956. v. 28, no. 3) ca. 800 refs. in German. Summary in English and Finnish. Title tr.: Investigations of plant-biological and some other consequences of the recent climatic fluctuation in Finland.

Contains a survey of recent, icosaeonic (=20th century) climatic fluctuations, as evidenced in the milder winters, hence in the ice conditions, summer temperatures, etc. in Finland. The effects on the flora are also surveyed: such as the unusually vigorous growth of annual rings and height of trees and the increased proportion of herbs of southern origin. A study of phenological phenomena, generative reproduction of plants and their distribution and frequency show that they have been greatly influenced by recent climatic changes. The flowering of spring plants has become earlier and tree leaves yellow later. The northern species have moved northward but show little tendency to spread in their southern limits. Cultivated plants, such as trees and shrubs, cereals, fodder plants, etc., are also spreading northward. This and the increased growth of forest trees implies a considerable increase in the national wealth of Finland. emphasizes, however, that the peak of icosaeonic climatic fluctuation may have passed, and recommends caution in extending farming settlement in Lapland. Copy seen: DLC.

44797. ERMAKOV, A. V. Rulony iz derna. (Priroda, Aug. 1956, no. 8, p. 113-

14, 2 illus.) Ref. Text in Russian. Title tr.: Sod rolls.

"This form of sod deformation associated with suprapermafrost water was observed in the Chukotsk Peninsula on slopes where solifluction occurred. The rolls were formed from sod 30-40 cm. thick and were probably associated with vertical moisture gradients that exerted differential lateral pressures during freezing,"—SIPRE. Copy seen: DLC.

44798. ERMAKOV, DMITRIĬ, and N. ERMAKOV. Za nas ne pridetsiā krasnet'. (Molodoĭ kolkhoznik, Dec. 1956. god 23, no. 12, p. 2.) Text in Russian. Title tr.: One will not blush with shame for us.

Letter written by volunteer workers at Noril'sk; describing the digging by hand of a foundation trench 15 m. deep in the frozen ground. **Copy seen:** DLC.

A method of repairing damaged bow and bottom of ships is described, the arrangement of reinforcing steel rods, passing through frames and beams is explained and diagrammed. The reinforced system was enclosed with thin wooden boards and the space between filled with concrete. The work was carried out at air temperature of  $-6^{\circ}$  to  $-11^{\circ}$  C.

Copy seen: DLC.

44802. ERVITS, M. Zadelka proboiny s pomoshch'iù zhelezobetona. (Morskol flot, Mar. 1946. god 6, no. 3, p. 16-19, Text in Russian. Title tr.: illus.) Repair of a hole in the ship with reinforced concrete.

A hole made in the side plates, by ice or explosion was tightly closed on the outside by wooden boards and canvas. Steel rods and wires connected with frames and beams formed the reinforcing screen for concrete. The screen was covered by boards on the inside, holding the poured concrete until it hardened. Copy seen: DLC.

44803. ESKIMO. The Eskimo and the principle of conserving hot air. Eskimo invention, the "kukukpak." Eskimo boot and Manning boot. (Eskimo, Dec. 1956. v. 42, p. 18-21, diagrs.) Ref.

Three notes, dealing briefly with: (1) construction of Eskimo dwellings, gravity control of heat and ventilation and application of this principle to clothing, with diagrs. of E. Arctic snowhouse, Baffin Island earth and moss hut, Mackenzie Delta hut with wooden frame, Point Barrow hut, also clothing of Eastern Arctic Eskimo; (2) reasons for the "kukukpak," the point at the top of Eastern Arctic Eskimo hood; (3) construction of "iperauserk," summer boot, and improvements by Tom Manning. Copy seen: DLC.

44804. ESKIMO. On the rights of the Eskimo, (Eskimo, Mar. 1956, v. 39,

p. 3-5.)

Contains brief discussion, in relation to current changes in the North, of Eskimo rights as to place of residence, child nurture, choice of school, hospital, spending their money, etc. Case is made against taking sick Eskimos south for treatment, and against arbitrary exercise of authority by whites generally.

Report on the effects of starvation and cold starvation upon liver glycogen and blood glucose of wild adult animals. On exposure to 0° C. after 12 hrs. of starvation, half of the animals died in 5.9 hrs., the remainder showed 0.779 mg. of glycogen per gram of liver and 24.8 mg. of glucose per 100 cc. of blood. The corresponding values in controls were 20.03 mg. and 106.8 mg. Injections of cortisone (50 mg./kg. body weight) did not increase survival time of those which died but may have increased gluconeogenesis in survivors. Copy seen: DA.

ESPENSCHADE, P. W., see Mardoian, F. M., and others. How to winterize construction equipment. 1956. No. 46617.

44810. ESSEN, REINHOLD von. Air operations of the Norwegian-British-Swedish Antaretic Expedition in 1952. (Polar record, Sept. 1956. v. 8, no. 54, p. 230–36, 2 illus., text map.)

Two small aircraft accompanied the Norsel from Sweden to evacuate this expedition at Maudheim. Sea-ice reconnaissance was carried out en route, and air photography (nine major flights) to assist topographic survey at the base. Preparations were made for air evacuation of the expedition, in an emergency (not The aircraft, their transport realized). aboard the Norsel, equipment and methods are described, including personnel (six), navigation, radio, and air photography. It is stressed that carefully planned use of small aircraft for photography of limited areas in conjunction with ground survey parties can produce mapping results comparable with those of much bigger projects. Copy seen: DLC.

44811. ESSO AIR WORLD. Finnair Aero O/Y; the story of Finnish Air Lines. (Esso air world, Nov.-Dec. 1955. v. 8, no. 3, p. 58-62, 13 illus., 2 tables.)

The development of the state airline in Finland is described. The company founded by Consul Bruno Lucander obtained its first airplane in 1923 and scheduled domestic service began in 1937. The domestic network provides service with the capital and every important town at least twice daily. The airline operates a West European service, and also flies into Moscow. Development of airfields, types of aircraft, company or-

ganization (private till 1946), etc., are sketched. Passenger and freight statistics for the period 1948-1954 are tabulated. *Copy seen:* DLC.

**44812.** *ESSO AIR WORLD.* The flying Lambs. (Esso air world, Sept.–Oct. 1954. v. 7, no. 2, p. 44–46, 6 illus.)

A brief history is given of Lamb Airways, a bush-flying and general transport service operated out of The Pas, Manitoba by Tom Lamb and his sons. The service began in 1935 and currently operates five planes, tractors, sleighs, etc. Typical assignments are noted: charter flying, mercy flights, transport of mining equipment from Churchill across the Barren Grounds, airlifting supplies to Geological Survey parties, etc.

Copy seen: DLC.

44813. ESSO AIR WORLD. Pacing Canadian aviation. (Esso air world, July-Aug. 1955. v. 8, no. 1, p. 16-21, 17 illus.)

An illustrated, historical account of the development of Canadian aviation is presented. The first heavier-than-air flight in Canada was made by Douglas McCurdy flying a 35-hp. biplane over frozen Bras d'Or Lake on Feb. 23, 1909. The development of bush flying in northern Canada came rapidly after World War I, primarily as a means of developing the mineral wealth in the area. The supply of aviation fuels and lubricants during the early days of Canadian aviation is emphasized.

Copy seen: DLC.

44814. ESSO AIR WORLD. Rotarywings over Greenland. (Esso air world, May-June 1956. v. 8, no. 6, p. 160-63, 10 illus.)

The use of helicopters in Greenland to expedite geodetic work on the ground is described and illustrated. Aerial survey of Greenland was completed in 1952, and helicopters operated by the Royal Danish Air Force cooperated with the Royal Geodetic Institute to provide rapid The first expedition transportation. equipped with two helicopters arrived at Scoresby Sund in July 1953. About 300 landings were made at 68 different stations during the period July 11-Sept. 2, with total flying time amounting to about 200 hrs. A similar expedition was carried out during the summer of 1954. operations were highly successful, corresponding to what could have been achieved in eight to ten seasons using traditional methods. Copy seen: DLC.

44815. ESSO AIR WORLD. The veterans of the airways: Alaska Coastal's Lockheed Vega 5 C. (Esso air world, Sept.-Oct. 1954. v. 7, no. 2, p. 54-55, 3 illus.)

Contains brief description of a veteran commercial aircraft built in 1929 and still in service. The plane is currently operated by Alaska Coastal Airlines of Juneau. Its original Pratt & Whitney Wasp C-1 engine was replaced in May 1945 by a Pratt & Whitney R-985 Wasp Jr. and a constant-speed airscrew was fitted.

Copy seen: DLC.

44816. EULER-CHELPIN, ASTRID MARIA (CLEVE), 1875—, and L. PAIJKULL. Genom Lule Lappmark; två flickors vandringsminnen från sommaren 1895. (Svenska turistföreningen, Stockholm, Årsskrift, 1896. p. 227–40, 5 illus.) Text in Swedish. Title tr.: Through Lule Lappmark; memories of two girls' wandering in the summer of 1895.

Up the Lule river valley from Gällivare, via Harsprånget, Stora Sjöfallet, Kvikk-jokk, and Virijaure, to Bodø, these travelers related their experiences, with emphasis on plant life. A number of arctic species are identified and Nuonjes cited as the most interesting locality botanically. Clothing, supplies and expenses en route are noted.

Copy seen: DGS.

44817. EVANS, ALEXANDER WIL-LIAM, 1868- . Notes on the genus Herberta, with a revision of the species known from Europe, Canada and the United States. (Torrey Botanical Club. Bulletin, Apr. 1917. v. 44, no. 4, p. 191-222, 29 illus., plate 8.) 25 refs.

Contains historical notes, a morphological sketch, a key and descriptions of four species of hepatic genus Herberta, or Herbertus as it was originally spelled. Two are described as new, one is a new combination. Synonyms, critical notes and lists of specimens are given. H. hutchinsiae n. sp. occurring in Sitka,

various localities in Alaska and St. Paul Island of the Pribilofs, is included.

44818. EVANS, EDNA HOFFMAN. January and snow. (Nature magazine, Jan. 1956. v. 49, no. 1, p. 48-50, illus.)

Contains description of techniques of photographing under snow conditions. Use of a medium yellow filter to absorb blue skylight, a deep yellow filter for more striking effects, or a red filter for extreme contrast is suggested. Backlighting, filters for color film, and new cameras are discussed.

Copy seen: DLC.

44819. EVANS, FREDERIC. Military hygiene in the Arctic. (Army quarterly, Oct. 1956. v. 73, no. 1, p. 82–87.)

Contains a discussion of special problems of hygiene encountered by British troops in the subarctic area around Arkhangel'sk during 1918-1919. malarial measures were not necessary in summer, and centralized incinerators downwind from the city disposed of refuse adequately. Underground storehouses banked with ice harvested during the winter were utilized for refrigeration. Disinfecting chambers were specially designed to reduce lice infestation in the winter. Bean shoots, etc., were grown as scurvy preventative. A special bathing and disinfecting train was utilized for troops at the front. Copy seen: DLC.

44820. EVGENOV, NIKOLAĬ IVANO-VICH, 1888- Nekotorye voprosy terminologii morskikh l'dov. (Meteorologiâ i gidrologiîa, July 1956. no. 7, p. 34–36, 2 illus.) 12 refs. Text in Russian. *Title tr.:* Several problems in the terminology of sea ice.

Different interpretations of the same term are discussed as a problem in the effort towards standardization. Terminology of ice concentration is discussed: characteristics of conglomerated, consolidated and close ice are given. The shipboard observer's position in relation to wind direction is a factor in designation of ice, comments are made on characteristics of leeward and windward edges.

Copy seen: DLC.

44821. EVJEN, SIGURD, 1894—. Holdepunkter for temperaturvarsler på lengere sikt. (Naturen, Dec. 1950. årg. 74, nr. 12, p. 371–77, 2 refs.) Text in Norwegian. *Title tr.:* Standards for long range temperature forecasting.

Temperature records for individual months at Ås were divided into warm, moderate, or cold, to determine means of forecasting temperature for a particular month on the basis of preceding data. Summer months are more predicatable than winter. Predictions for Ås, a village near Oslo, were found applicable to the Skagerrak coast; and as far away as Finnmark they are more applicable than otherwise. Suggestions are made for more extended comparisons and possibilities.

44822. EVJEN, SIGURD, 1894—. Number of cyclones and anticyclones in northwest and middle Europe. (Norway. Meteorologiske institutt. Meteorologiske annaler, 1954. bd. 3, nr. 16, p. 459–85, 7 text maps, 5 graphs, 17 tables.) Ref.

During 1946-1950, cyclone and anticyclone centers were counted on daily weather maps four times a day in an area approx. 45°-80° N. 35 °E.-35° W., including northern Scandinavia, Svalbard, Greenland Sea, and part of Denmark The preliminary report on anticyclone centers was listed as No. 28955. Monthly and yearly numbers of centers within the area and its 32 subdivisions are presented in charts, tables and graphs, with discussion. Strong, medium, and weak centers are distinguished. relations are considered between mean air pressure and numbers of centers, standard deviations and distribution curves of each square, and the geographical distribution of cyclone and anticyclone centers during the various seasons. Copy seen: DWB.

44823. EVJEN, SIGURD, 1894— . Statistisk varsling av middelverdier. (Naturen, 1955. Årg. 79, nr. 6, p. 162–83.) Text in Norwegian. *Title tr.*: Statistical forecasting of averages.

Monthly temperature averages, of little value in themselves, are derived by means which have greater practical applications. In this discussion, records from Andenes, northern Norway, are included and evaluated.

Copy seen: DLC.

44824. EVSEEV, S. F. Razvitie narodnogo obrazovaniâ v Âkutii i pomoshch' russkogo naroda. (In: Akademiâ nauk SSSR. Âkutskii filial. Institut îazyka, literatury i istorii. Vedushchaîa rol' russkogo naroda . . . , 1955. p. 172–81.) 11 refs. Text in Russian. Title tr.: The development of public education in

Yakutia and the aid rendered by the Russian people.

Reviews the creation of Russian schools (1732–1917) in Yakutia: naval schools (akademii) in the 18th century, public and parochial elementary schools in the 19th century. The development of the school system in the Soviet period is sketched and selected statistical data on schools, students, teachers, schooling of adults and public education budget for 1924–55 are given. Copy seen: DLC.

44825. EWERDAHL, SUNE. Ice helped construct the Lulea bridge in northern Sweden. (World construction, Apr. 1956. v. 9, no. 4, p. 48-50, 53-54, illus., diagrs.)

Details of the construction of this drawtype bridge at the Lule River mouth, 65 miles south of the Arctic Circle are described. The bridge is the double bascule type with an over-all length of 2939 ft. The main facilities used for winter work are described and illustrated.

Copy seen: DLC.

44826. EWING, HENRY ELLSWORTH, 1883- . The dermanyssid mites of North America. (U. S. National Museum. Proceedings, Jan. 27, 1923. v. 62, art. 13, no. 2459, p. 1–26. 7 illus., 2 plates.)

Contains keys to the subfamilies, genera and species of the family Dermanyssidae, descriptions of the genera and of 23 species. Two subfamilies, six genera and eleven species are described as new. Ichoronyssus semitectus from a lemming, Myodes torquatus (p. 13) is recorded in Greenland.

Copy seen: DLC.

44827. EWING, HENRY ELLSWORTH, 1883- . A revision of the American

lice of the genus Pediculus, together with a consideration of the significance of their geographical and host distribution. (U. S. National Museum. Proceedings, June 10, 1926. v. 68, art. 19, no. 2620, p. 1–30, 8 illus., 3 plates.) 25 refs.

Contains a discussion of this genus with data on taxonomy and economic importance, keys, and a list of nine species and varieties. Two distinct groups are considered, one confined to man, the other to monkeys. A sub-genus, two species and one variety are described as new. P.(Pediculus) humanus angustus, a Japanese race, was brought to America by Orientals: three were "taken by Dr. L. Stejneger in 1882, from an Aleutian Eskimo at Bering Island." These lice

appear to be hybrids. Data on geographical distribution of lice and their hosts are appended. **Copy seen:** DLC.

**44828. EWING, MAURICE,** and **W. L. DONN.** A theory of ice ages. (Science, June 1956. v. 123, no. 3207, p. 1061–66,

illus., map.) 45 refs.

Contains "a preliminary report of new ideas related to the origin of glacial climates" based on 20 years' observations. It is postulated that "some mechanical process has caused the poles to migrate to positions very favorable for the development of glacial climates." The changes during the Pleistocene are assumed to have resulted from alternations of icefree and ice-covered states of the Arctic Ocean caused by polar dislocation from its freely circulating to enclosed areas. The same mechanism could explain similar climatic changes in earlier epochs. The theory complies with the doctrine of uniformitarianism and claims no external or catastrophic events. Challenged by I. I. Schell in Science, Feb. 8, 1957, v. 125, p. 235.

Copy seen: DLC.

44829. EXIDE TOPICS. Hunting icebergs. (Exide topics, Mar.-Apr. 1956. v. 30, no. 2, p. 2-3, illus., text map.) Contains a brief popular account of the work of United States Coast Guard vessels and aircraft for the International Ice Patrol. The Labrador Current collects as many as 7,500 sizeable bergs each year; course is plotted of the 50-1400 which cross the 48th parallel, and where shipping is warned. Function of the electric storage battery in communications and shipping generally is stressed.

Copy seen: DLC.

44830. EXPÉDITION GLACIOLOGI-QUE INTERNATIONALE AU GROEN-LAND. Réunion du 3 au 8 Avril 1956 en Suisse. Grindelwald, 1956. 26 p. Mimeographed. Text in German or French. Title tr.: International Glaciological Expedition to Greenland. Meeting of April 3-8, 1956 in Switzerland.

Reports on meetings of scientists from eight countries at Grindelwald and Jungfraujoch Research Station under presidency of Prof. R. Haefeli. This expedition was organized and the scientific program outlined. The principal countries participating are Germany, Denmark, France, and Switzerland. The E. G. I. G. will be supported by the Union Géodésique et Géophysique Inter-

nationale and directed by Paul-Émile Victor. The principal aims are glaciological investigation of a west-east strip of the Greenland inland ice between 69° and 73° N.; creation and measurement of a permanent network of markers for the control of movement, variation, and balance of the inland ice for long distances, seismic investigations north of 74° N. lat. The program is provisionally scheduled during the International Geophysical Year.

\*\*Copy seen: CaMAI.\*\*

44831. EXPÉDITIONS POLAIRES FRANÇAISES. Terre Adélie, Groenland, 1947–1955; rapport d'activités. Paris, Arthaud, 1956. 152 p. illus., text maps, diagrs. Text in French. Title tr.: Adélie Land, Greenland, 1947–1955;

report of activities.

Contains report on the eight consecutive years' work of ten French expeditions (110 participants) in Greenland, Iceland, and Antarctica. Background. program, and organization are dealt with in pt. I: headquarters in Paris, the Scientific Commission, and activities from the foundation of Expéditions Polaires Françaises in 1947 to July 20, 1955. In pt. 2 (p. 29-82) each expedition to Terre Adélie and Greenland, is outlined in turn: program, preparation and supply, personnel, events, camps (plans of huts, etc.). Work in Iceland 1950-1953 is described. Sketch is given of A.-P. Martin, A. Joset, and J. Jarl who died during the expeditions. Scientific objectives, program and operations are presented in pt. 3: technical phases, equipment, food, medicine, photography, etc., observations are listed, but no data given.

44832. EXPLORERS CLUB, New York. Told at the Explorers Club; true tales of modern exploration. Edited by Frederick A. Blossom. New York, A. & C. Boni, 1931. x, 425 p. diagrs., plates.

Thirty-three explorers recount some adventure experienced in their travels, several of them in arctic regions as listed below:

Bartlett, R. A. Bringing the crippled *Roosevelt* home, p. 29–52: Account of the return voyage of Peary's 1905–1906 ex-

peditionary ship under the author's com-The ship had been damaged mand. during the wintering at Cape Sheridan (82°30' N.) on northern Ellesmere. En route to New York (July 4 to Dec. 24) two of the four propeller blades sheared away and the rudder was destroyed; emergency steering gear was rigged. Stops for refueling, repairs, or to discharge Eskimos used by Peary were made at Etah, Kookan, Cape York, Hebron, Hopedale, Battle Harbour, Port-aux-Basques, and Sydney, Cape Breton.

Ekblaw, W. E. Thin ice, p. 81-89: Account of author's experience on a hunting expedition with two Greenlanders. The party camped on sea ice in Wolstenholme Sound after harpooning a large walrus, and was nearly cut off from shore by a lead which developed on approach of a southerly gale. Men and dogs crossed the lead successfully when it was covered with a thin layer of new ice.

Fiala, A. At close quarters with a polar bear, p. 91-96: Leader of the Fiala-Ziegler Expedition, 1903-1905, on the west coast of Rudolf Island tells of decoying a large polar bear by imitating seal, and his rifle failing to fire till the bear was 15-18 ft. away.

Frothingham, R. Walrus hunting with the Eskimos, p. 123-37: Describes experiences during a walrus hunt off Wainwright, Alaska in summer of 1930, when cutter Northland transferred 15 natives and three umiaks to the ice pack about 25 miles off shore; 26 walruses were taken and an adequate winter supply assured for the village.

Hobbs, W. H. A week's adventures in Greenland, p. 151-63: Recounts adventures in southwest Greenland Sept. 1928, when author's party located the lost Rockford flyers, Hassell and Cramer (cf. No. 7148) and the entire group was shipwrecked, then rescued by a small Danish vessel. A photograph of Dr. Hobbs with the lost flyers is included.

McConnell, B. M. Rescued from the "death trap" of the Arctic, p. 223-38: Describes the loss of the Karluk in the north of Alaska on Stefansson's Canadian Arctic Expedition of 1913–1918, and the subsequent rescue of survivors marooned on Vrangel Island.

Riesenberg, F. Arctic ghost, p. 285-300: Recounts experience of a small wintering party of the Wellman Polar Expedition of 1906-1907 encamped in a haunted hut on Danish Island off Vest-

spitsbergen.

The royal road to Stefansson, V. humdrum, p. 321-36: Presents anecdotes from author's experiences to dispel misconceptions: that eating snow when thirsty is dangerous; that snow should be rubbed on frost-bitten areas; that the arctic night is depressing; etc.

Wilson, E. B. Adventure off the Alaskan coast, p. 409-417: Relates author's first passage aboard the converted schooner Dora on her regular trip Seward-Unalaska-Bristol Bay in 1913, and pictures travel conditions on passenger boats of the day.

44833. EXPLORERS JOURNAL. [Expeditions.] (Explorers journal, 1956. v. 34, no. 1, p. 12-17; no. 2-4, p. 6-14 illus., ports.)

Contains notes on the following: John McCall Memorial Expedition in Alaska, which made first ascents of University and McCall Peaks, third ascent of Mt. Bona, and unsuccessful attempt on Mt. Blackburn, May-June 1955 (no. 1, p. 12); mountaineering expeditions in summer 1955 to the Chugach Range, Alaska (three ascents), and Logan Mts., Mackenzie District: 16 first ascents (no. 1, p.

Ninth consecutive summer of scientific studies on the Juneau Ice Field, Southeast Alaska, by seven-man party led by E. R. LaChapelle, summer 1956 (no. 2-4, p. 11);

Departure of Soviet expedition led by N. A. Volkov of the Arctic Research Institute to make oceanographic, magnetic, and meteorological observations at and near the North Pole, spring 1956 (no. 1, p. 15);

Two expeditions of the Oceanologic Institute of the Soviet Academy of Sciences, summer 1955, which explored the depression surrounding the Aleutian Islands to a depth of more than 22,960 ft., studied structure of mountain chain from Hawaii to Aleutians, and collected data on fishing grounds (no. 1, p. 17);

British university expeditions, summer 1955: Nottingham geological and glaciological expedition to Vestspitsbergen; glaciological expedition to Nordaustlandet by Oxford; Cambridge Expedition to East Greenland where geological, ethnological, botanical and zoological collections were made and geese were banded. (no. 2, p. 6).

44834. EYDAL, ÁSTVALDUR. Some aspects of the herring fishery and herring industry of Iceland. (In: International Geographical Union. Eighth General Assembly and Seventeenth International Congress, Washington, D. C., Aug. 8-15, 1952. Proceedings, pub. 1956? p. 612-15, illus., 2 text maps.)

Contains information on the history, methods and yields of this fishery since its beginnings in 1870. Biology of herring. local species, research on distribution and migration are outlined. Utilization of north- and south-coast herring, herring products and their quality; also econonomics of the industry generally are discussed. Copy seen: DGS.

44835. EYINCK, DONALD H. Alaska, the 49th state? (American city, Sept. 1956. v. 71, no. 9, p. 168, 172, 174.)

Contains brief description of parts of Alaska's new constitution, drawn up during winter 1955-1956 by a group of delegates and adopted by election on Apr. 24. 1956. The organization of state government, emphasis on local self-government, and provision for changes in the constitution are noted. Copy seen: DGS.

44836. EYTHÓRSSON, JÓN PÉTUR, 1895 - Report on sea ice off the Icelandic coasts in Oct. 1954-Sept. 1955. (Jökull, 1955. År. 5, p. 47-51.) In continuation of No. 34633-34634, 39754.

Based on aircraft, shipboard observations between Iceland and Greenland, and meteorological station reports. Iceland coasts were practically free of sea ice during this period: scattered drift ice approached the northwest coasts for a few days, and single icebergs or floes were seen occasionally. Reports, by month, show day, and latitude and longitude of ice boundary. Ice concentration (coverage) is given, in tenths. No maps are provided. Copy seen: DGS.

44837. F., K. A. En rundresa i Norrbotten 1891. (Svenska turistföreningen, Stockholm. Årsskrift, 1892, p. 181–204.) Text in Swedish. Title tr.: A round trip in Norrbotten, 1891.

Writer traveled from Piteå, via Aborrträsk and Arjeplog to Nasa, where an old silver mine is located on the Swedish-Norwegian boundary; and continued down Lonsdalen and to Bodø in Norway. The return route was via Sulitjelma to Kvikkiokk. Travel conditions in July were good; regions traversed are well described. Copy seen: DGS.

44838. FADEEV, E. Pervichnaîa obrabotka shkurok. (Okhota i okhotnich'e khozîaIstvo. Jan. 1956, no. 1, p. 9-13, illus., fig.) Text in Russian. Title tr.: Primary processing of hides.

Brief technical instructions, including processing of arctic fox, squirrel, muskrat, and other northern fur-bearers' skins.

Copy seen: DLC.

44839. FAEGRI, KNUT, 1909- . Da kvenene overfalt Ottar. (Naturen, 1955, årg. 79, nr. 4, p. 124-26.) Text in Norwegian. Title tr.: When the Lapps attacked Ottar.

Reviews work on Ottar, a ninth century Norwegian geographer, and reports of the Lapps, probably from the Torneträsk region in Sweden, following streams with light boats, crossing the drainage divide into the Bardu and Alta region of north coastal Norway, and encountering the Norsemen, probably near Malangen in Troms, where Ottar is believed to have lived. Copy seen: DLC.

44840. FAEGRI, KNUT, 1909- . Om utbredelsen av Siphula ceratites (Whg) E. Fr. i Norden. (Blyttia, 1952. bd. 10, hefte 3, p. 77-87, illus., text map, table.) 20 refs. Text in Norwegian. Summary in English. Title tr.: On the occurrence of Siphula ceratites in the North.

This lichen, occurs in scattered locations along the Norwegian and Kola Peninsula coast and in northern Sweden; apparently it has unique ecological requirements. Damp, coarse, shallow, slightly acid soil may be a concurrence factor, because the species also occurs where solifluction prevents closed vegetation cover. Whether it belongs to refuge flora of the glacial period should be investigated. Copy seen: DLC.

44841. FAEGRI, KNUT, 1909- . Omkring granens innvandring i Vest-Norge. (Naturen, July-Aug. 1950. Årg. 74, nr. 7, p. 226-39, 2 diagrs., 2 text maps.) Text in Norwegian. Title tr.: Migration of the pine into western Norway.

Pine may have survived on some of the botanical refuges believed ice-free during the last glaciation; Yoldia arctica thrived along the Norwegian coast at that time. At present, on the West Greenland coast, this species is found only very far north. Nowhere that it is found do trees grow under normal hydrographic conditions. Twigs of Scandinavian pine are always fuzzy or covered with hair except those on Norway's west coast, in a limited part of Swedish Lapland, and on Kola Peninsula, where both smooth and hairy twigged types occur.

Copy seen: DLC.

44842. FAEGRI, KNUT, 1969– and E. MOSS. On the occurrence of the genus Codium along the Scandinavian coasts. (Blyttia, 1952. bd. 10, hefte 4, p. 108–113, illus., text map.) 14 refs. Text in English. Summary in Norwegian.

Rarely seen along the Norwegian coast until recent years, Codium is one of the algae presently common immediately below low tide level where fresh-water streams are lacking. Its occurrence at Røst, north of 67° N. is possible because of the ocean temperature well off the mainland.

Copy seen: DLC.

44843. FAEGRI, KNUT, 1909– . På botanisertur i Junkerdalen. (Naturen, 1956. Årg. 80, nr. 3, p. 131–52, 3 illus.) Text in Norwegian. *Title tr.*: On a botanical tour in Junkerdalen.

In Junkerdalen, Nordland, are two rare species of plants: a Saxifrage found also in one southwestern Norwegian locality; and a Carex otherwise unknown to Europe, but found elsewhere in the Arctic. From these occurrences the author leads to discussion of plant habitats, the northern Norwegian plant refuges, bedrock, climate and botanical history.

Copy seen: DLC.

44844. FAEGRI, KNUT, 1909—. Some reflections on the trophic system in limnology. (Nytt magasin for botanikk, 1954. v. 3, p. 43-49, diagr.) 11 refs.

1954. v. 3, p. 43-49, diagr.) 11 refs. In modern limnological literature "trophic" is generally defined as pertaining to the organic production of lakes. This concept is discussed with respect to aretic lakes, all of which are oligotrophic from a productive point of view. Conclusion is offered that a lake should be classified according to its climate, morphology of the basin, and chemistry of the water, because these are expressed in the flora and fauna. Copy seen: DA.

44845. FAGERSTRÖM, LARS. Ostfennoskandiens Collema-arter. (Societas

pro fauna et flora fennica. Memoranda, 1954-55. v. 31, p. 38-42.) Text in Swedish. *Title tr.: Collema* species of eastern Fennoscandia.

Finnish species (17) of this lichen genus are tabulated for the provinces in which they occur, and the geographic distribution is discussed. Eastern Fennoscandian provinces are listed with the number of species recorded in them. In northeastern Fennoscandia, Kuusamo has 12 species, Finnish Lapland five, and Russian Lapland eight.

44847. FAHRIG, WALTER FREDE-RICK, 1926– . Cambrian Lake (west half), New Quebec. Ottawa, Queen's Printer, 1956. Map sheet 22 x 24 in. (Canada. Geological Survey. Paper 55-42.) 2 refs.

Map (scale 1 in.: 4 mi.) with detailed marginal notes covers the area 56°-57° N. 69°-70° W. in the Kaniapiskau River basin. The western two-thirds of the map-area is composed of the Archean pre-Kaniapiskau group of granite and granitoid gneisses with inclusions of more basic gneiss. The easternmost map-area is underlain by the Proterozoic Kaniapiskau group of sedimentary rocks. Stratigraphy and structure of the younger group are described. Iron-formation outcrops were examined previously for iron ore, but no deposits of commercial The quartz-pebble value were found. conglomerates west of Cambrian Lake should be investigated for radioactive minerals. Copy seen: DGS.

44848. FAHRIG, WALTER FREDE-RICK, 1926- . Lac Herodier (east half), New Quebec; map with marginal notes. Ottawa, Queen's Printer, 1956. Map sheet 24 x 26 in. (Canada. Geologi-

cal Survey. Paper 55-37.)

Map (scale 1 in.: 4 mi.), with detailed marginal notes, covers the area 57°-58° N. 68°-69° W., south of Fort Chimo, between Koksoak and Whale Rivers and including False River basin. The eastern boundary of the Labrador Trough crosses the southwestern corner of the map-area. Precambrian bedrock includes sedimentary, intrusive, and volcanic rocks which have been regionally metamorphosed and deformed as a unit, the degree and grade of metamorphism increasing toward the northeast. The major structures of both the Labrador Trough strata and the metamorphic rocks to the east trend northwest. Extensive interest has been shown in chalcopyrite and nickeliferous pyrrhotite deposits, but the iron formation of the region is not likely to be economically important.

versity. Typescript.

Studies of ablation, climatology, and meltwater runoff were conducted during the summer of 1955 and in March 1956 in the vicinity of an independent ice cap near Nunatarssuaq, 76°57' N. 66°58' W. (64.5 km. northwest of Thule). Meteorological data were collected at five stations placed in the area. These data are tabulated, and meltwater discharge as related to cloud cover, radiation, and wind is graphed. Ablation data were obtained with ablation stakes set above the ice cliff and placed horizontally into the ice cliff as well as with an ablatograph. The amount of snow melt, effect of elevation on melting, and average daily meltwater produced are graphed.

44860. FAWLEY, ALLAN P. Geology of the Lasthope Lake area, Granville Lake division, Manitoba. Winnipeg, Queen's Printer, 1952. 27 p. fold. map 24 x 41 in., tables. (Manitoba. Dept of Mines and Natural Resources. Mines Branch. Publication 49–5.) 2 refs.

Map (scale 1 in.: ½ mi.) covers the area 56°30′-45′ N. 100°45′-101° W.,

about 17 mi. south-southeast of Lynn Lake. Access and physical features are briefly described. Field work was carried out in summer 1949. Consolidated rocks include the Archean Wasekwan volcanic and sedimentary series, the overlying Sickle sedimentary series, and post-Sickle intrusives. Gneisses similar to those of the Kissevnew complex to the south cannot be placed stratigraphically and may be of more than one age. Faults, generally trending north throughout the map-area, are reflected in the topography. Suggestions are given on prospecting for nickel-copper and gold. A gold-bearing vein is described.

Copy seen: DGS.

44861. FAWLEY, ALLAN P. Geology of the Sickle Lake area, Granville Lake division, Manitoba. Winnipeg, 1949. 19 p. fold. map 30 x 41 in., tables. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Report and map, 48–6.) 2 refs.

Map (scale 1 in.: ½ mi.) covers the area 56°30′-45′ N. 100°30′-45′ W., about 20 mi. southeast of Lynn Lake. Mapping was done June-Sept. 1948. Physical features are described. Consolidated rocks are Precambrian. Volcanic and metamorphosed sedimentary rocks of the Archean Wasekwan series are intruded by igneous rocks and overlain by the Sickle sediments, over 10,000 ft, thick and intruded by diorite sills and pegmatites. Other intrusives also appear to be post-Sickle in age. The Sickle sediments are folded into two basins which trend generally north. Faults also trend north and are reflected by the topography. No orebodies are known to date. Further prospecting should be accompanied by a geophysical survey. Chemical analyses are given of ten rocks from the area. Copy seen: DGS.

44872. FERNALD, ARTHUR THOMAS, 1917—, and A. S. HOROWITZ. Bedrock geology of the Nunatarssuak area. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954. p. 11–25, illus.) 5 refs.

The results of investigations on the types and distribution of bedrock material, its usefulness for military engineering purposes, and the geological history of the area are reported. The area is underlain by about 85 percent metamorphic and igneous rocks, 14 percent sedimentary rocks and 1 percent diabase. Active frost-splitting, promoted and directed by prominent jointing in the bedrock, has produced throughout the area large rubble fields of two types: bedrock outcrops 1-20 ft. thick which cover only a small part of the area, generally valley bottoms and very steep cliffs; and rubble essentially in place or only slightly moved. Foundation conditions are generally good throughout the area, except along the south border of Nunatarssuak because of steep slopes, and in red and black shale in the south-The availability of construction materials in each geological unit and necessary excavation procedures are also considered. Recommendations for future studies are included. The present project resulted in a bedrock map of the area on a scale of 1:50,000. No additional field study for military purposes on the bedrock is recommended.

Industrial future of these regions is discussed in relation to the variety and complexity of the geochemistry of this great assemblage of rare earths. Most of chemical elements in the tundras are arranged in the Mendeleev table (p. 96), also in three separate groups: common elements of alkaline magmas; elements of alkaline agpaitic magma; and rare elements. Industrial value of these elements is indicated. Mineralogical distribution of the more useful elements is shown for: apatite, nepheline, titanomagnetite, titanite (sphene), lovchorrite, molybdenite, eudialyte, loparite, aegirin and pyrrhotite. For each, chemical composition, geochemical and technological characteristics are given.

p. 320-22.)

Contains sky brightness measurements in northern latitudes from 44°-80°, based in part on writer's observations at Tikhaya Bukhta, Franz Joseph Land. Averages are given of observations made from Oct. 1940-Apr. 1941. They refer to a region of the sky near Polaris at about local midnight when the sun was more than 20° below the horizon and when there was no moon and no appreciable aurorae. A visual photometer was used with a radioactive luminous field. the field of view being about 5°.

44894. FILIPPOV, A. E. O dvizhenii srednego polûsa zemli. (Astronomicheskiî zhurnal, May-June 1956. t. 33, vyp. 3, p. 414–22, graphs, tables.) 13 refs. Text in Russian. Summary in English. *Title tr.:* The motion of the earth's

mean pole.

The reliability of present data on the secular motion of the earth's mean pole is discussed. Some peculiarities of its motion, derived from results of latitude observations do not represent its real displacement. Their cause should be sought in the nonpolar variations of the mean latitudes of the international stations. As there are only three stations, these variations lead to the unreliability of any results on the secular motion of the mean Therefore, at present, only coordinates, accounting for the periodic motion of the instantaneous pole, should be used.—From author's abstract,

Water penetration through frozen litter

of various structures and compositions is discussed on the basis of special investigations in 1952-53 as well as published studies. Differences in the structure and moisture content of frozen litter were reflected in large variations in water permeability. Shallow freezing and high permeability were observed for frozen soil with water contents of less than 4 mm. in the upper 1 cm., since in such cases the percentage of ice-free pores reached 50-60 percent. Water contents of 4-7 mm. decreased the percentage of ice-free pores to 20 percent and permitted deeper freezing. Moisture-saturated litter froze deeply and was impervious to water.

A thesis presented to the Faculty of Graduate Studies and Research, McGill University, in partial fulfillment of the requirements for the degree of Doctor of Philosophy. Montreal, Nov. 1955. 296 p. 55 illus., 14 text maps, diagr., 7 tables (2 fold.). Mimeographed. Approx. 225 refs.

Based on field work, mainly in the Fort Chimo region May-Sept. 1954, also on observations in Greenland, Finland, and Iceland during 1947–1952. A study of the human ecology of these Eskimos, some 750 in number, to aid in their adaptation to changing conditions, in an area to be exploited for iron ores. The physical geography of the region, its historical background, and the Eskimos' present way of life are described. Almost all de-

pend in part on government relief, and most have had little contact or experience with white men. Principles of policy, and ways of improving conditions are suggested: mostly by developing produce for the coming white market. Introduction of sheep-farming, gardening, poultry-keeping, etc., is advocated, as well as development of fruit-gathering, fishing, the working of sealskin, wool and eiderdown, and boatbuilding. Appended is description of the economic situations of seven Eskimo families in the southern Ungava Bay region.

Fifth edition of atlas which first appeared in 1920 under title Suomen Karta över Finland. Contains four index maps at scale 1:2,000,000, 57 sectional maps at 1:400,000, and 63 town maps at various scales. The area north of the Arctic Circle is covered by 33 sectional maps. National and civil administrative boundaries, relief, lakes and rivers are shown, as well as main and village roads, footpaths and winter tracks, railroads, settlements, farms, mines, saw-mills, airports, and a town plan for Rovaniemi is given. Alphabetical index of place names is included.

FISCHER, JOHANN EBERHARD, 1697–1771, see Herzog, R. Eine russische Handschrift . . . 1953. No. 45536.

44903. FISCHER, WILLIAM AUGUS-TINE, 1888- . Photogeologic mapping in Alaska. (*In:* Alaskan Science Conference . . . 1952. Proceedings, *pub.* 1954, p. 29–31.)

Plans for such mapping by Alaskan Branch, U. S. Geological Survey are noted. In northern Alaska reconnaissance maps at scale 1:96,000 now coverapprox. 50,000 sq. mi. This series is being recompiled at 1:250,000. Precise structure-contour maps of selected anti-

clines in Naval Petroleum Reserve no. 4 are also being made. Seven factors aff-feeting reliability of photogeologic maps in Alaska are noted. *Copy seen:* DGS.

44904. FISCHL, FRED B., 1921–, and others. Cold starting with V. I. improved multigrade oils. (SAE Transactions, 1956. v. 64, p. 608–620, diagrs., 15 tables.) Discussion p. 621–24. Other authors: H. H. Horowitz, and T. S. Tutwiler.

Low-temperature performance of test oils was obtained at  $0^{\circ}$ ,  $-10^{\circ}$ , and  $-20^{\circ}$ F. Significant differences were found in engine cranking speed for 10 W-30 oils formulated with different polymeric V. I. improvers. The viscosities of V. I. improved oils deviated very appreciably from ASTM extrapolated viscosities. This variation is due to differences in the low shear viscosities of the improved oils not predicted by the ASTM chart and also due to temporary viscosity loss. A new system is outlined for estimating viscosities of improved oils at low temperatures. Copy seen: DLC.

44905. FISH, PIERRE A. The cerebral fissures of the Atlantic walrus. (U. S. National Museum. Proceedings, Apr. 9, 1903. v. 26, no. 1325, p. 675–88, plates 28–29.) 7 refs.

Contains descriptions of two walrus brains obtained for the U. S. National Museum by R. Stein, in North Greenland in 1901. The fissural pattern of walrus resembles, in general, the typical arrangement in the brain of carnivorous animals (cat, dog and bear). The presylvian area is greater in length than the postsylvian.

pub. 1954. p. 345-49, illus.)

The objectives, program, and methods used in glaciological, seismological, gravimetric, meteorological, and trafficability investigations made from July 9-Aug. 25 by Party Solo, composed of 15 men and traveling in seven weasels, are summarized; the results are evaluated; and recommendations for future work are made. The studies included: the near-surface and surface characteristics of snow (temperature, density, viscosity, permeability, and hardness); snow and ice stratigraphy, ablation, and accumulation; the effect of vehicle traffic on snow and the efficiency of sled-runner design; the velocity of seismic waves in snow and ice; development of seismic crevassedetection techniques; and weather as it affects glaciological, trafficability, and airnavigation conditions. One of the objectives of Party Solo was the determination of the feasibility, present and future, of the Thule Ramp to Mile 60 route; the other was the determination of the capability of the inland ice for the movement of heavy vehicles.

44908. FISKE, C. O. White-out, a polar weather phenomenon. (United States Naval Institute, *Annapolis*, *Md.* Proceedings, Sept. 1956. v. 82, no. 9, p. 954-59, illus.)

Contains discussion of the causes and effects of whiteout on the basis of experience gained during Operation Deepfreeze in the Antarctic. Possible countermeasures are proposed. Whiteout causes a complete loss of shadow and horizon

definition and a rapid decrease in depth perception and visual perspective. It is often accompanied by acute vertigo resulting in various degrees of nausea. The hazard of snow blindness is increased during whiteout since the light is intensified by reflection and re-reflection in all directions, and the normal "sixth sense," which warns of danger in the presence of obstructions, is lacking. Whiteout occurs when a uniform overcast exists over a completely snow-covered surface. It is most dangerous with a low ceiling (1,000-2,500 ft), a solid overcast, and a diffuse stratiform mist. The phenomenon results from ice crystal accumulation caused by sublimation over a uniform, freezing ice field, and is most pronounced over frozen water areas and over the polar icecap. Divergent views on whiteout are noted, also use of colored lenses. Copy seen: DLC.

4499. FITZGERALD, GERALD, 1898— . Why map Alaska. (*In*: Alaskan Science Conference . . . 1953. Proceedings, *pub*. 1956., p. 63.)

Full development of Alaskan land and sea resources depend on transportation and development of many new communities. Basic data in map form are necessary in early stages of such planning, and for military defense.

A study of body temperature, respiratory rate and O<sub>2</sub>-consumption in mice less than 24 hrs. old, exposed to environmental temperatures of 0° to 34° C. Only respiratory movements within 15° to 30° followed the Arrhenius equation. At lower temperatures and in O<sub>2</sub>-consumption this equation proved not applicable. Copy seen: DLC.

44911. FITZPATRICK, E. A. An indurated soil horizon formed by permafrost. (Journal of soil science, July 1956. v. 7, no. 2, p. 248–54, 5 illus. on 3 plates.) 7 refs.

The origin and characteristics of very compact layers found in freely drained soils in Scotland and other humid temperate regions are described. Indurated layers of varying thickness are characteristic of past or present periglacial conditions in a large variety of soil groups, occurring in flat or irregular terrain and on slopes as steep as 40°, usually at a depth of 16-24 in. The upper surface of the layer is sharply defined, while the lower surface is diffuse. The structure is both massive and platy with spherical and vesicular pores and a sheath of fine material around the larger stones. The upper surface of this layer probably represents the lower limit of the active layer in permafrost, a view supported by the writer's observations in the Longyearbyen region of Vestspitsbergen in summer 1954, and by laboratory freezing of wet soil. The platy structure is due to gradual freezing under wet conditions, the massive structure to rapid freezing. The spherical and vesicular pores are caused by the freezing of soil water containing dissolved gases.—From SIPRE.

Bulletin, 1898, pub. 1899. v. 4, pt. 1, no. 2, p. 16–27, plate.) Refs in text. Text in German. Title tr.: On several rare minerals from the region of Langesund in Norway.

Includes, with a crystallographic description of epididymite (p. 20), a reference to the author's recognition of this mineral, occurring similarly with eudidymite near Narsarssuak in southwest Greenland, on a journey there in summer of 1898 (i. e. 1897). Copy seen: DLC.

44916. FLINT, GEORGE MARSH, 1918 - Résumé of the geology and geomorphology of the islands of the Bering Sea. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1806–1807.)

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30, 1956. The islands lie in shallow waters of northeastern Bering Sea. Except for St. Lawrence and Nunivak with large masses of sedimentary rocks, the islands are predominantly volcanic. Volcanic activity on St. Lawrence and the Pribilofs probably continued to Recent time. Economic minerals are scarce and islands' striking geomorphic features may attract tourist trade. Copy seen: DGS.

Copy seen: DLC.

44928. FÖYN, ERNST, and others. The radioactivity of seawater. Göteborg, Elander, 1939. 44 p. tables. (Göteborgs kungl. vetenskaps och vitterhetssamhälle. Handlingar, 5 följden, ser. B. bd. 6, no. 12.) 23 refs. Other authors: B. Karlik, H. Pettersson, and E. Rona.

The methods and results of measurements of the uranium, radium, and thorium content of seawater at a number of stations are discussed. Uranium measurements were made at latitudes from 45°-73° N., radium from 55°-58° N. and thorium from 55°-58° N. The results indicate that the radium present in these northern waters is less than ½0 of what has been previously assumed. A remarkable scarcity of thorium was also noted with only an upper limit of the amount present being determined.

44932. FOLINSBEE, ROBERT ED-WARD, 1917—. Archean monazite in beach concentrates, Yellow-knife geologic province, Northwest Territories, Canada. (Royal Society of Canada. Transactions, 1955. Third ser., v. 49, sec. 4, p. 7–24, 3 illus., graphs, 2 tables.) 49 refs.

Contains results of a study of two sands from esker-derived beach placers in the northern part of the Lac de Gras map-area (64°15′-65° N. 110°-112° W.), one a monazite-bearing sand from Yamba Lake (65° N. 111°30' W.), the other a monazite-free sand from Exeter Lake (64°45' N. 110°45' W.). Bedrock and glacial geology of the map-area are briefly described. Magnetite, ilmenite, and almandite garnet are the dominant minerals of the monazite-bearing concentrate; 17 other heavy minerals are identified and described. "The injection gneiss or migmatite, source of the monazite, has been assigned to the Archean (2,200-2,400 million yrs.) on the basis of field relations confirmed by potassium-argon and other age-dating methods. The relation of the gneiss to other rocks of the Yellowknife continental nucleus has been established." Copy seen: DGS.

FONES, T. H., see Mardoian, F. M., and others. How to winterize construction equipment. 1956. No. 46617.

FONOROW, B., see Bates, C. C., and B. Fonorow. Ice observations . . . 1956. No. 43904.

44934. FONSELIUS, STIG, and others. Carbon dioxide variations in the atmosphere. (Tellus, May 1956. v. 8, no. 2, p. 176-83, diagrs., tables, text maps.) 30 refs. Other authors: F. Koroleff and K. E. Wärme.

A scatter diagram of mean values obtained in Scandinavia from 1800-1955 is presented, and monthly and seasonal for 1955 are graphed. The possibility of using these values as a method of synoptic weather analysis is discussed and illustrated. There is some indication that an increase in atmospheric carbon dioxide has occurred since 1935. However, this may be only a short-term fluctuation in the climate. Generally, values are highest in winter and reach minimum values in summer and fall. Measurements will be continued, and new ones are planned for Spitsbergen during the International Geophysical Year.

44935. FONTAINE, MARION. The planktonic copepods (Calanoida, Cyclopoida, Monstrilloida) of Ungava Bay, with special reference to the biology of Pseudocalanis minutus and Calanus finmarchicus. (Canada. Fisheries Research Board. Journal, 1955. v. 12, p. 858–98, illus., tables.) About 75 refs.

A study based on midsummer collections 1947, 1949 and 1950 of the Calanus in the Ungava Bay and central Hudson Strait. Twenty-two species were found and their distribution determined; four are new for the American side of the North Atlantic. Investigations on the development and life cycle of two most common species, Calanus finmarchicus and Pseudocalanus minutus, are reported as well as more limited observations on the life histories of two other species. Breeding time and development did not show a uniform trend in the various species. Copy seen: DI.

FONYÓDI, SARALTA, see Hársing, L., and others. Hypothermia hatása . . . 1956. No. 45458.

44936. FORCHER-MAYR, O. Der Föhn als medizinisches Problem. (Wiener medizinische Wochenschrift, 1956. Jahrg. 106, no. 9, p. 212–20, tables.) Refs in text. Text in German. *Title tr.:* The foehn as a medical problem.

Contains an extensive review and discussion of the problem, with information on earlier studies in the German-speaking areas; effects on the human organism (according to various authorities) including pathological effects and effects in various diseases; tests for objective verification of widespread symptoms; analysis and discussion of these tests; microclimatic factors; routes of attack on the human body; systems affected; human types of reaction to the foehn therapy of adverse effects; electric-wave theories of pathological foehn effects; weather and health statistics; etc.

"Depressions crossing eastern N. America [approx. 40°-60° N. 50°-80° W.] may either move on eastward or turn north or northwest and stagnate; the latter are influenced by Greenland. The two types occur in spells of a few days to a week, and tend to be associated with characteristic hemispherical upper flow patterns. The stagnating depressions are associated with slow troughs of large amplitude, but the characteristic pattern is often not reached until nearly the end of the spell and is not a useful indication for medium range forecasting. In most cases the surface and upper patterns evolve together. Differences in development of individual depressions may depend on details of the thermal structure. The paper is illustrated by numerous 500 mb and surface hemisphere charts."-Meteorological abstracts & bibliography, Jan. 1956. v. 7, no. 1, p. 120.

44940. FORSSLUND, KARL HERMAN, 1900–. Nattsländor: Trichoptera. (*In:* Sjöstedt, Y. Insektfaunan inom Abisko nationalpark, III, pub. in Svenska vetenskapsakademien. Skrifter i naturskyddsärenden, 1931. nr. 18, p. 46–55.) Text in Swedish. *Title tr.:* Caddis flies: Trichoptera.

Eight families of Trichoptera are represented in this collection from arctic Sweden. Of the four species found in larger streams, Stenophylax impar is known from northern Fennoscandia east to northern Siberia. From minor streams the forms differed, in some cases abnormal, probable sterile specimens. Still waters, especially swampy areas, were rich in this fauna. Identification is discussed; 44 species are listed; location, habitat, collector and date are cited. Geography of the order cannot yet be established.

44942. FORWARD, CHARLES N. Sea ice conditions along the Hudson Bay Route. (Geographical bulletin, 1956. no. 8, p. 22–50, 16 text maps.) 12 refs. Summary in French.

Based on Canadian Ice Distribution Survey data in the Geographical Branch, summary for Hudson Bay and Strait, Ungava Bay. Bathymetry, water movements and properties, and climate of the area are described; also distribution and origin of sea ice and glacier ice (icebergs and growlers). Ice conditions Jan. through Apr. and for each month thereafter are considered, with maps showing limits of main ice areas in average years, most favorable and least favorable years, on 13 selected days during July 1-Nov. Variability of ice conditions from year to year and the influences of temperature and wind are discussed. Navigation season (minimum marine insurance rates), at present July 23-Oct. 10, could be extended if aerial reconnaissance provided more definite information on conditions in early July and if growth of shore ice at Churchill and other points could be controlled in the fall. **Copy seen:** DGS.

44943. FOSTER, CHARLES R., and S. J. KNIGHT. A review of soil and snow trafficability. (In: U. S. Office of Ordnance Research. Interservice Vehicle Mobility Symposium, 18-20 Apr. 1955. v. 2, Papers, p. 1-9, 5 illus., diagrs.)

The research program of the Waterways Experiment Station on this problem is outlined. Trafficability is defined as the ability of a soil or snow to permit the movement of a vehicle. This ability may be measured directly by running vehicles over the medium; or indirectly by the use of aerial photographs or by study of the effect of meteorological parameters on the moisture content and thus strength of a soil. Snow trafficability studies were begun in Greenland in the summer of 1954 and brief tests have been conducted at Fort Churchill, Houghton, Mich., and Kapuskasing, Ontario. Data are still too limited on snow for valid conclusions. Copy seen: DLC.

FOSTER, GLENN L., see Bartlett, R. G., and others. Gross muscular activity . . . temperature regulation . . . restrained rat. 1956. No. 43892.

44944. FOSTER, J. B. The phenacomys vole in eastern Canada. (Ontario field biologist, May 1956. no. 10, p. 18–22, illus.) 5 refs.

Results of a study of the life history and ecology of *Phenacomys ungava*, carried out in the vicinity of Fort Chimo, Quebec, in 1953 and Fort Churchill, northern Manitoba, in 1954. Scrubby vegetation, with willow usually predominating, is the typical habitat of this vole; the nests of shredded paper, moss or plant fiber are few inches below the surface; willow, bearberry and blueberry are usually stored in burrows.

44945. FOTIADI, É. É. Opyt sostavlenifâ skhemy stratigraficheskikh sootnoshenif dokembriiskikh porod Russkof 
platformy i Urala. (Akademifâ nauk 
SSSR. Doklady, Aug. 21, 1956. t. 109, 
no. 6, p. 1194–96, fold. table.) 26 refs. 
Text in Russian. Title tr.: An attempt 
to work out a scheme of stratigraphic 
relations between the Precambrian rocks 
of the Russian platform and the Urals. 
Study of these rocks which form the

folded basement of the region. They include the so-called "Baltic Shield" (Fennoscandia and Kola Peninsula) and the Ural Mountains with Timan Ridge and Kanin Peninsula. They may be divided into two main groups: supercrust or effusive-sedimentary rocks, and magmatic rocks. The stratigraphic structure of the region is reviewed, upward, as (1) lower Archean rocks: various gneisses and crystalline schist; (2) upper Archean: granite, migmatite, magnetic quartz, etc.; (3) lower Proterozoic: various supercrust rocks, as schist, quartzite, dolomite, sandstone, etc.; (4) upper Proterozoic: metamorphic terrigenous formations; viz. quartzite, schist, sandstone, etc.; and (5) earlier middle and lower Paleozoic: metamorphic and sedimentary rock for-Scheme of detailed subdivisions and rock structure is included (fold. table). Copy seen: DLC.

44946. FOURNELLE, HAROLD JOHN, 1909— . Experience with the laboratory diagnosis of enteric diseases in Alaska. (American journal of medical technology, Dec. 1956. v. 22, no. 6a, p. 36–43.) 10 refs.

Account of laboratory findings in the survey made by the Arctic Health Research Center among the Eskimo population of the lower Kuskokwim River, southwestern Alaska. Diarrheal problems were effected by two types of Shigella flexneri, with children of ten years and less mostly affected. Salmonella typhosa was isolated in a few instances. In parasitic infections Endamoeba coli and Diphyllobotrium sp. were most numerous.

Copy seen: DNLM.

44947. FOURNELLE, HAROLD JOHN, 1909— . Studies of changes in sewage held at low temperatures. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 74–75.)

Account of bacterial counts of sludge samples holding temperatures of -13°, -17° and -21° C. supplemented by counts of such sludge kept (and examined) up to six months at subzero temperature). The greatest reduction was during the first 24 hrs. with Gram-negatives mostly affected.

44948. FRADKIN, M. M. Petrograficheskii sostav valunov na severe Zapadno-Sibirskoi nizmennosti. (Akademiia nauk SSSR. Komissia po izuchenin chetvertichnogo perioda. Būlleten', 1946. no. 8, p. 82-94, illus., diagr., map.) Text in Russian. Summary in English. *Title tr.:* Petrographic composition of boulders in the northern part of the West

Siberian plain.

Result of a route survey carried out in 1936-37 from Surgut (61°15' N. 73°23' E.) on the middle Ob', up the Torm-Yaun (i. e. Trom-Yugan, 62°55' N. 72°50' E.) and down the Nadym River to Ob' Bay. Moraines and the other glacial deposits were investigated; petrographic characteristics and mineralogical composition of 27 samples of boulders and rocks are noted. It is concluded that "the relief in the basin of the Nadym River is younger than that of the Surgut region. The petrographic composition of the boulders in the Nadym terminal and main moraines also differs from that of the boulders of the maximum glaciation in the Surgut region." Copy seen: DLC.

44949. FRÄNKL, ERDHART. Some general remarks on the Caledonian mountain chain of East Greenland. København, C. A. Reitzel, 1956. 43 p. text map, diagrs., section, tables. (Meddelelser om Grønland. bd. 103, nr. 11.) 61 refs.

Report originally intended to accompany geologic map (not published) prepared by the author in 1953 from investigations during the Danish East Expeditions, Greenland 1948-1953. Three main structural elements occur in East and North Greenland: East Greenland geosyncline from approx. Kejser Franz Josephs Fjord north to Danmarks Fjord (73°-81°30' N.); North Greenland geosyncline across northernmost Greenland from about 20°-60° W.; the Hagen Fjord geanticline between the two geosynclines. Stratigraphy and tectonics of these belts are discussed on the basis of pre-Caledonian, Caledonian (Ordovician-Devonian), and post-Caledonian (Carboniferous-Quaternary) periods. Geological data strongly favor the formation of the "Scandic" (Greenland) Sea by gradual subsidence, progressing from north to south, of a block between Scandinavia and Greenland. Copy seen: DGS.

44960. FRASER, J. KEITH. Physiographic notes on features in the Mackenzie delta area. Abstract. (Canadian geographer, 1956. no. 7, p. 20.)

"Evidence is presented to show that a group of knobby hills on coalescing alluvial fans along the Richardson Mountains is landslide debris rather than glacial deposit. Associated with the debris are pingo-like features and lenses of groundice. A heavy layer of silt over remnant snowbanks is attributed to wind deposition."

Comptes rendus, 1956. t. 150, no. 5, p. 1053–56.) 9 refs. Text in French. Title tr.: Investigations on the behavior of the chondriome of fibroblast cultures maintained at subnormal temperatures.

Chick-embryo fibroblasts and myoblasts kept at temperatures of 1°, 5°, 10° and 18° C. showed first a slowing in the movement of the chondriosomes, then a change from filamentous to short and finally globular forms. These modifications appeared only after several hours of cold exposure.

At constant daily illumination, falling environmental temperature increased the running activity of both normal and hypertensive rats; this activity was, however, higher in the normal rats when temperatures dropped to 20°, 15° and 10° C., suggesting that hypertension tends to limit increased activity normally observed in cold environment.

44969. FREUCHEN. PETER. 1957. Fremdeles frimodig. København, Gyldendal, 1955. 236 p. (Erindringer v. 2) Text in Danish. Title tr.: Still frank. (Recollections, v. 2.)

Second part of an autobiography covering Freuchen's life as factor at Thule, the Fifth Thule Expedition to Canada in 1921-24, his life in Denmark as farmer, journalist and author, and extensive travels in Europe and North America lecturing and film-making. Details of a long journey in arctic Russia in 1937 are given. During the occupation of Denmark during World War II, Freuchen was captured by the Germans but fled to Sweden and afterwards settled in the United States.

The first part of this autobiography, I al frimodighed (In all frankness), København, Gyldendal, 1953, deals with Freuchen's childhood and youth and his life to the Fifth Thule Expedition (copy at MnU). English version Vagrant Viking (No. 29107) covers the period of both Danish volumes. Copy seen: DLC.

44977. FRIEDMAN, EDWARD W., and others. Hypothermia in hemorrhagic shock. (American journal of physiology, June 1956. v. 185, no. 3, p. 521–27, tables.) 19 refs. Other authors: D. Davidoff and J. Fine.

Cooling dogs to 28° C. prior to provoking a standard shock reaction, pro-

longed the times of tolerance to hypotension and of survival after transfusion, but did not prevent death. However, this protective effect of cooling was not forthcoming if applied after the induction of shock. An antibiotic given at time of transfusion to hypothermic dogs caused a recovery, but was ineffective in normothermic controls. Thus precooling appears to sustain the antibacterial defense in hemorrhagic shock, which otherwise disintegrates rapidly.

Contains summary of author's report, previously listed as No. 21967.

Copy seen: DLC.

44980. FRISTRUP, BØRGE. Peary Land. (Naturens verden, 1951. Årg. 35, p. 19-33, 9 illus.) Text in Danish. Title tr.: Peary Land.

Exploration of Peary Land, northern Greenland, is reviewed from its first sighting by Lockwood on the Lady Franklin Bay Expedition, 1881-1884. The first detailed scientific investigations. made in 1948-1950 by an eight-man party under Eigil Knuth, the Danish Pearvland Expedition, are summarized. Description is given of the region: area. elevation, the geology, glaciation hydrography, climate, flora and fauna and Eskimo occupance. In the dry continental climate, evaporation is an important factor in ice and snow removal. The summer snowline lies at 1,200 m. elevation. Cryoconite effects are noted. More than 300 plant forms were collected, some new to Greenland; they included 90 varieties of vascular plants, 120 varieties of mosses, lichens, etc. Eskimo campsites, tools, and equipment are commonly found in Peary Land.

Oslo, Aschehoug; Cambridge, Mass., Harvard University Press, 1952. 216 p. diagrs., illus., tables. (Instituttet sammenlignende kulturforskning. for [Publikationer] Serie B; skrifter 46.) Title tr.: Text in Swedish. 80 refs. Woodlands and swamps in northern Sweden in their function as pasturelands and meadows.

Introduction of domestic animals into

northern Sweden from the south forced development of summer pastures and meadows where winter fodder could be harvested. Useful plant species in the forests and swamps were determined from experience and means of improving their productivity developed. Competition with the Lapps for the land and reduction of reindeer winter forage are discussed and exemplified. Characteristics of the environment, plant ecology, and control of undesired species are dealt with in detail. Regulation of growth in swamps by water regulation (both flooding and drainage), opening up of forest lands by cutting and burning, provision of plant nutrients by land management, and crop rotation have been adapted to local conditions. Plant species are identified by scientific names throughout and plant associations are related to regulation of their environment in abundant examples. Copy seen: DLC.

44983. FRÖLING, NILS. Pältsastugan, Sveriges nordligaste turiststuga. (Svenska turistföreningen, Stockholm. Årsskrift, 1949. p. 355–57, text map.) Text in Swedish. *Title tr.:* Pältsastugan, Sweden's northernmost tourist hut.

Brief description of the northernmost tip of Sweden, with some regional orientation. Travel thither is usually via Kiruna, Abisko, and Torneträsk; but this tourist hut can now be reached by a short journey from the international highway between Karesuando in Finland and Skibotn on the north Norway coast. The interior of northern Norway is also accessible from the west.

44989. FROLOV, A. M. Mery obespechenifa ustoIchivosti zemlfanykh mass i sooruzhenif. Moskva, Gosud. Transportnoe zheleznodorozhnoe izd-vo, 1949, 1952. 2 v.: 364, 320 p., illus., tables, diagrs., 80 refs. Text in Russian. Title tr.: Measures providing stability of earth masses and construction.

Textbook approved by the Main Administration on Education of the Ministry of Ways and Means Communications for the High Technical Schools.

Various problems in deformation of earth masses and construction are discussed, with analysis of the causes of disruption in their stability. Measures are described for preventing the appearance and development of deformation. Effects of temperature variation, especially freezing of ground water are analyzed (v. 1, p. 106-109; v. 2, p. 79). Physical and mathematical formulations of landslide problems are outlined (v. 1, p. 140-47). Stability of road and railroad construction on marshland and specific methods of reinforcing the ground are discussed in detail (v. 2, p. 80-106). The measures for prevention of swelling, naleds and similar deformations appearing periodically in connection with freezing and thawing of the ground are described. Character, height, form and level of ground swelling are outlined (v. 2, p. 156-88) and consequences indicated.

May 1947; 1st rev., Jan. 1948; 2d rev., May 1948. 6 p.l., 98, 6 l., 45 photos. 71 refs. *Other authors*: J. E. Hittle, and K. B. Woods.

"An account is given of the progress concerning one phase of the use of aerial photographs in the investigation of airfield construction in arctic and subarctic regions. Data were obtained from field investigations conducted during the 1945, 1946, and part of the 1947 summer field season at various locations in Alaska and are summarized by correlating the observations with airphoto patterns of the same areas. The natural setting, location, geology, soil texture ranges, native vegetation, and permafrost conditions in the vicinities of Fairbanks, Big Delta, Tanana valley, Kougarok, and Northway are described. Repeated field checks showed that similar patterns in aerial photographs indicate similar materials and that airphotos can be used to identify soil and rock textures, to bound areas of similar materials, to select better construction sites, and to identify and locate materials for engineering construction."-SIPRE. Problems encountered in resupply by sea of the joint U. S.-Canadian weather stations in the Canadian Arctic Islands are described briefly. Mould Bay on Prince Patrick and Isachsen on Ellef Ringes have never been supplied by ship. Supplies for these stations are landed by ship at Resolute Bay and then transferred by air. Ice-breakers receive cargo by transfer at Resolute or Thule for transporting to stations at Eureka and Alert on Ellesmere Island. Copy seen: DLC.

4497. FUCHS, ALFRED. Preparation of plastic replicas and thin sections of snow. Wilmette, Ill., Nov. 1956. iv, 6 p. diagrs. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. Technical report 41.) 3 refs.

Formulas and details are given for making plastic replicas of snow samples for petrofabric studies utilizing Formvar. The work is generally performed at about —10° C., and replicas may be coated with a second clear film of plexiglas to improve durability. A technique is also described for filling the pores in snow samples for thin-section analysis without changing the snow structure.

45000. FUKUTOMI, TAKAHARU. Study of sea ice: the 19th report. Relation between the beginning date of freezing and air temperature at the coasts of the Sea of Okhotsk, the Japanese Sea, and the arctic sea. (Teion-kagaku, Low temperature science, Sapporo, 1953. Ser. A, Physical sciences, v. 11, p. 87-94, 3 graphs, table.) 9 refs. Text in Japanese. Summary in English.

This relation was studied to test the theoretical equation developed earlier (cf. No. 34795). The equation was found to be satisfactory as a first approximation. The time interval between the calculated date at which the decreasing air temperature reaches the freezing point of sea water and the observed date of commencement of freezing lies in the range of  $16\pm 6$  days, being variable with the mean depth of the coastal water mass and with the wind velocity.—from English summary. Previous reports have been listed as No. 29157–29159, 34795.

Copy seen: DWB.

45001. FUKUTOMI, TAKAHARU. Study of sea ice: the 20th report. A study on the formation of sea ice at the surface of the deep sea. (Teion-kagaku, Low temperature science, Sapporo, 1953. Ser. A, Physical sciences, v. 11, p. 95–106, diagr., 2 tables.) 6 refs. Text in Japanese. Summary in English.

"The additional effect of heat flow from lower levels on the time of beginning of freezing in the Okhotsk Sea is discussed. The effect of the heat flow is negligible in the northern half of the Sea but is moderately large in the southern half. The time between the date at which the air temperature reaches the freezing point of sea water and the date of the beginning of freezing, and the maximum ice thickness are given for N. lat. as follows: 22 days and 130 cm. at 60°; 25 days and 115 cm. at 55°; 31 days and 87 cm. at 50°; and 43 days and 45 cm. at 45°."-SIPRE. Adds to information given in the 4th report (Arctic Bibliography, No. 34795).

Copy seen: DWB.

45002. FUKUTOMI, TAKAHARU, and others. Study of sea ice: the 21st report. A report on the survey of ice on the Okhotsk Sea coast of Hokkaido. (Teion-kagaku, Low temperature science, Sapporo, 1954. Ser. A, Physical sciences,

v. 13, p. 59-103, 40 illus. on 20 plates, diagrs., graphs, 13 tables.) 14 refs. Text in Japanese. Summary in English. Other authors: K. Kusunoki and T. Tabata.

Investigation of sea ice conditions conducted since 1942 is described. Observational data on temperature variation and distribution within and on ice and water are given in tables and graphs. Data include salinity, density, mechanical properties and other characteristics of ice and water. Report is illustrated with 40 photographs of typical ice formations.

Title tr.: Climate of Middle Angara region and upper Lena River basin.

The dry, cold, anticyclonic continental climate of the area north and east of Lake Baykal, roughly 53°-57° N. 98°-108° E. is characterized for spring, summer, fall and winter, with specific reference to the Angara basin, the watershed, and the Lena basin. Air temperature (mean, max. and min.), prevailing winds, precipitation, temperature inversions droughts in spring and summer, influence of arctic air masses, etc., are noted in course of the discussion. Summer weather (with max. daily temperature at least 20° C. and min. over 0° C.) lasts but 27-16 days in this area. The severe drought of 1915, which caused great forest fires with dense smoke shrouding all central Siberia, is described and extent of the devastation mapped (p. 165). Copy seen: DLC.

45018. GALAKHOV, N. N. Mikroklimaticheskie nablūdeniū v ralonakh Srednego Priangar'ū i basselna verkhnel Leny. (Akademiū nauk SSSR. Institut geografii. Title tr.: Microclimatic observations in the region of the Middle Angara and the upper Lena basin.

Since the beginning of the 20th century. the climate of the Angara-Lena area (roughly, 53°-57° N. 98°-108° E.) been observed by several geographical and botanical expeditions, and in 1950 it was studied by the climatological team of the Angara-Lena Expedition of the Institute of Geography. Results of these observations are presented in a characterization of the severe, continental climate of this area. It has daily fluctuations of air temperature amounting to 20-30° C. and frost occurring in June and even in July. Influence of the surface relief on air temperature, humidity, moisture of the soil, wind and vegetation in various localities is outlined and illustrated by graphs and diagrams, and the data are summarized on tables. The spread of autumnal color change and shedding of leaves in Aug.-Sept. is discussed and shown in map (p. 188). Copy seen: DLC.

45020. GALKIN, I. G. Vybor éffektivnogo sposoba zimnego betonirovania. Moskva, Gos. izd-vo stroitel'noI lit-ry, 1951. 92 p., tables, graphs, 12 refs. Text in Russian. *Title tr.:* Selection of an effective method for winter concrete work.

General theoretical and experimental studies on preparing concrete of specific qualities are described, with particular consideration of low temperature conditions. Among others, the so-called "Thermos" method is described, various steam- and electric-heating methods, combined methods, and use of heated compartments or sheds. Thermodynamic computations are given with experimental coefficients corresponding to various conditions and to different composition of the concrete mixture according to its use (in foundations, floors, columns, beams, etc.). In conclusion, an analysis of various methods is offered, with sets of curves for variation of strength, time of setting, with temperature and other factors. Copy seen: DLC.

45021. GALLOWAY, R. W. Études morphométriques de galets dans le Lyngsdal, Norvège septentrionale. (Revue de géomorphologie dynamique, Mar.—Apr. 1956. année 7, no. 3-4, p. 53-56, sketch map, graph.) 5 refs. Text in French. Summary in English. *Title tr.*: Morphometric studies of pebbles in Lyngsdal, northern Norway.

"The evolution of the shape of pebbles in the outwash stream of the Lyngsdal glacier was studied in relation to the gradient of the talweg and the distance of transport. It was found that the smoothness evolved independently of the gradient and varied as the log of the distance of transport. The flatness remained constant. A comparison of stones from terraces with those in the present river bed enabled the approximate distance to the ice snout when the terraces were deposited to be estimated."—

Author's summary. Copy seen: DGS.

45022. GALLOWAY, R. W. Mechanical measurement of glacier motion. (Journal of glaciology, Mar. 1956. v. 2, no. 19, p. 642-44, sketch map, diagrs., graph.) 9 refs.

An instrument for continuously recording ice movement at a point on the glacier surface is described. Test results on Lyngsdalsbreen, made during the 1953 Edinburgh University Lyngen Expedition in North Norway are given. A single wire is run from a point on the valley side to a pulley arrangement on the glacier surface and returned to another point on the valley side the same distance from the pulley. Glacier movement turns the pulley which is coupled to a recording clock drum. The method has considerable limitation, but is suitable for small expeditions.—From SIPRE.

45023. GALLOWAY, R. W. Rides de façonnement glaciaire sur une moraine de fond dans le Lyngsdal, Norvège septentrionale. (Revue de géomorphologie dynamique, Nov.—Dec. 1956. Année 7, no. 11-12, p. 174-77, diagrs.) 8 ref. Text in French. Summary in English. Title tr.: Glacially-made ridges on a

ground moraine in Lyngsdal.

Ice-ridged ground moraine on Lyngen Peninsula (69°20′-70° N. 20° E.) is described and subdivided into a long, low type probably formed by erosion of till by the fluted undersurface of the glacier and a tapering type found on the distal side of boulders and formed by till accumulating in subglacial tunnels. Formation of the latter type is discussed, and conclusion offered that the material may have accumulated by deposition from the roof of the tunnel, rather than by injection of wet plastic till as previously suggested by some authors.—From author's abstract.

100

Investigation of geological strata by using seismic waves of artificially produced local earth tremors is discussed. "Consideration is given (p. 189-94) to the problem of glacier study using elastic and reflected waves to determine the thickness and structure of glacier ice. Investigations of glaciers in Europe and Greenland are outlined, and the accuracy of the measurements is discussed. The homogeneity of glacier ice increases the accuracy, especially for reflected waves with their shorter oscillation period. Investigations in the Tim Region (area of the Kursk Magnetic Anomaly) discovered the effects of the strength and distance of blasts on the received oscillations. To exclude these effects, it is necessary to distribute the blast sources along an arc at an equal distance from the measuring instrument."-SIPRE. Copy seen: DLC.

45036. GARFIELD, VIOLA EDMUND-SON, 1899— Antecedents of totem pole carving. (In: Alaskan Science Conference . . 1953. Proceedings, pub. 1956, p. 242–48.) 11 refs.

Carving of columns by Northwest Coast Indians during the 19th century is described. These tribes (including Haida and Tlingit) lived in an area bounded on north by Yakutat Bay and on south by Straits of Juan de Fuca. The custom developed during the 18th century and derived from two main traditions common to the circum-North Pacific area: house construction with decorative houseposts, facade poles, etc.; and the custom of marking or supporting burials with carved or painted posts. Each antecedent is discussed, its influence traced. Early explorers' observations are cited.

45037. GARFIELD, VIOLA EDMUND-SON, 1899-, and L. A. FORREST. The wolf and the raven. Seattle, University of Washington Press, 1948. ix, 151 p. illus.

Describes the totem poles of the Tlingit Indian raven and wolf (or eagle) phratries, mostly of the late 19th century. The poles collected at the Saxman, Ketchikan, and Klawak Totem Parks, and Mud Bight village are dealt with, the represented legends retold and their origin and clan belonging given. The pole carving and painting techniques, artistic merits, religious and heraldic significance, symbolism, etc., are discussed in turn.

45041. GASSMANN, GEORGE J. Airborne ionospheric measurements in the North Pole area. (Journal of geophysical research, Mar. 1956. v. 61, no. 1, p. 136-38, diagrs.)

Preliminary results are presented of measurements made with equipment installed in a four-engine C-97 aircraft during 1954-55. The speed of fading of an ionospheric reflection is graphed. Two drift measurements made at the North Pole gave values of 41 m./sec. toward 290° and 33m./sec. toward 270°. No principal differences in ion density were noted between the North Pole, Resolute Bay, Baker Lake (Northwest Territories), or Point Barrow (Alaska). No vertical reflections from the F-layer were revealed on a large number of

occasions. Future plans for similar research are outlined briefly.

45043. GATES, GEORGE OSCAR, 1905- Developments in Alaska in 1955. (American Association of Petroleum Geologists. Bulletin, June 1956. v. 40, no. 6, p. 1390–94, text map.) 7 refs.

Exploration and drilling in 1955 were largely confined to southern Alaska. Two holes were completed and three recessed over the winter. Eight company geologic parties, one company seismic party, and three U. S. Geological Survey parties conducted field investigations in the Copper River Basin, the Matanuska valley, Kenai and Alaska Peninsulas, and in east-central Alaska in the triangle between the Yukon and Porcupine Rivers and the International Boundary. Oil and gas leases were issued covering nearly 800,000 acres, 90 percent in southern Alaska.

**45044.** GATES, OLCOTT, 1919—, and W. GIBSON. Interpretation of the configuration of the Aleutian Ridge. (Geological Society of America. Bulletin, Feb. 1956. v. 67, no. 2, p. 127–46, 3 illus., 6 maps (1 fold.), profiles, crosssections, table.) 30 refs.

Western part of the Aleutian Ridge (approx. 50°30′-53°30′ N. 170°-180° E.), is discussed on data from a contour map of the submarine topography surrounding the Near Islands and a previously published map of the Rat Islands (No. 29258). The general geology is summarized and four main submarine topographic provinces are discussed in order of increasing depth: crest of the Aleutian Ridge, insular slopes, Aleutian bench, Aleutian trench. Writer suggests that the western part of the Ridge "is an arched and faulted asymmetrical wedge bounded by a northward-dipping normal fault on the north and by a northwarddipping zone of reverse faults on the south. Formation of this wedge probably

began with major uplift and faulting of the . . . area during the middle Tertiary." Deformation is continuing.

**45066.** GEOGRAPHICAL JOURNAL. Expeditions in the field during 1955. (Geographical journal, Mar. 1956. v. 122, pt. 1, p. 124–26.)

Includes brief accounts of the following expeditions to arctic and subarctic regions. Size of parties is not given. Nottingham University North-West Spitsbergen Expedition, 1955; led by H. Mellor, the party carried out glaciological and geologic work in Vestspitsbergen in the Kongsfjorden region (79° N. 12° E.) ice cap to the east, and in the Krossfjorden region (79° N. 11°30' E.). Oxford University Expedition to North East Land, July 7-Sept. 13, 1955, led by J. T. Hollin, continued work of earlier Oxford expeditions; glaciological investigations were carried out on the Vestfonna (icecap, 79°50' N. 19°30' E.); surveys were made of the major features of several of the larger land outcrops and islands; marine soundings were made. A correction to this account appears in this journal, v. 122, pt. 2, p. 275.

Cambridge East Greenland Expedition, 1955, led by J. H. Latter, was to make investigations of arctic bird migration, a systematic collection of rocks, and general ethnological, botanical, and zoological collecting. Specific locality is not indicated.

45070. GEOLOGISKA FÖRENINGEN, Stockholm. Mötet den 1 december 1892. (Its: Förhandlingar, 1892. bd. 14, häfte 7, no. 147, p. 557-60.) Text in Swedish. Title tr.: The meeting of December 1, 1892.

Account is given (p. 558-59) of an illustrated lecture by Axel Hamberg on sea ice, glacier ice, and glacier movement, based on his experience in the Arctic. Temperature, porosity, salt and gas content, crystalline structure, and foreign matter are discussed with respect to their relations to the nature, position (above or under water) and movement of ice.

45071. GEORGES, G., and J. CAHN. Exploration de la réactivité du couple hypophyso-surrénalien sous neuroplégie, réfrigération externe et hibernation artificielle chez le rat. (Anesthésie et analgésie, 1956. t. 13, no. 4, p. 712-22, tables.) 7 refs. Text in French. Summary in English. Title tr.: Exploration of the reactivity of the hypophysoadrenal complex during neuroplegia, external cooling and artificial hibernation of the rat.

Studying the effects of neuroplegia upon the pituitary, the authors conclude that the combination promethazine-chlor-promazine, or Hydergine alone, are capable under certain conditions of preventing the appearance of pituitary hyperactivity. Hypothermia only, but not neuroplegia or artificial hibernation, exhibited an antagonistic effect towards ACTH. Copy seen: DNLM.

45072. GEORGES, G., and J. CAHN. Exploration de la valeur fonctionnelle du cortex surrénal sous neuroplégie, réfrigération externe et hibernation artificielle chez le rat hypophysectomisé. (Société de Biologie, Paris. Comptes rendus

1955. t. 149, no. 19-20, p. 1775-78, table.) 3 refs. Text in French. Title tr.: Exploration on the functional value of the adrenal in neuroplegia, external cooling and artificial hibernation of the

hypophysectomized rat.

s. wofknd.

e

1

.

Above investigations showed that deep hypothermia causes inhibition of adrenocortical activity by 25-30°, and that artificial hibernation is accompanied by cortical inhibition of the same order. The effects of neuroplegia without hypothermia are also evaluated.

45073. GEORGI, JOHANNES, 1890-Rapports scientifiques des Expéditions Polaires Françaises N IV 4. Temperaturund Dichtemessungen des Grönländischen Inlandeises. (Annales de géophysique, t. 12, no. 1, p. 102-110, diagrs., tables.) 12 refs. Text in German. Summary in French and English. Title tr.: Scientific reports of the Expéditions Polaires Françaises N IV 4. Temperature and density measurements of the Greenland inland ice.

"Investigations of the temperature and density of the icecap, initiated in 1912-13 by A. Wegener and continued in 1930-31 by E. Sorge, are reviewed and compared with studies made in 1950. Measurements in 1950 confirmed the discovery made in 1930 of a decrease in ice temperature below a depth of 8 m and Sorge's explanation that the colder layers reflected the pre-1920 climate and that heat supplied by the earth was transferred to the shore by subglacial streams and lost to the ice. Sorge's law of an increase in firn density with depth was confirmed."-SIPRE. Copy seen: DGS.

GERARD, ROBERT. 45074. Pollen sampling in permafrost. '(Micropaleontologist, Oct. 1954. v. 8, no. 4, p. 38.)

Abstract of paper presented at the Second National Pollen Conference, Boston, Dec. 28–29, 1953. "A method used in 1953 in central Alaska to take contamination-free permafrost samples from accurately measured depths is described. The method consists of melting a hole in permafrost by forcing unheated water through a nozzle at the end of a 1-in. pipe set vertically at the surface of the ground. As the hole produced by the water jet reaches the desired depth (at a rate of a few cm./min.) the pipe is replaced by a sampling tube which is hammered 6-9 cm. below the bottom of the hole. tube is then rotated and removed with the permafrost sample. The method permits sampling to depths of more than 100 ft."-SIPRE. Copy seen: DGS.

GERASIMOV, I. P., and K. K. 45075. MARKOV. Paleogeografia SSSR v lednikovyl period. (In: International Geological Congress. 19th Algiers, 1952. Comptes rendus, sect. 13, fasc. 15, pub. 1954. Questions diverses Troisième partie: de géologie générale. Paléontologie stratigraphique, Quaternaire et pétrographie. p. 289-304, 2 text Text in Russian. maps, diagrs.) Ref. Summary in French. Title tr.: Paleogeography of U.S.S.R. territory during

the glacial period.

Conditions throughout the U.S.S.R. during the Quaternary were linked to local physical geographic factors. The increasing continentality of climate from west to east resulted in the presence of a typical icecap in European U. S. S. R., thinner glacial cover in western Siberia, and no continuous glacial cover in the Far East. In European U. S. S. R. three separate glacial epochs occurred whereas in Siberia only one period has been distinguished. Geological, geomorphological, archeological, and paleobotanical research has traced the history of the Quaternary period. Physico-geographical changes during this period had important influences on development of prehistoric man. Copy seen: DGS.

45076. GERASIMOV, MIKHAIL MI-KHAILOVICH, 1907- . Vosstanovlenie litsa po cherepu; sovremennyť i iskopaemyť chelovek. Moskva, 1955. 585 p. illus., tables, maps. (Akademifa nauk SSSR. Institut ėtnografii. Trudy, nov. serifa, Text in Russian. t. 28.) Refs. tr.: Reconstruction of human face from skull; modern and fossil man.

Includes (p. 414-50) a description of the neolithic cultures of the middle Angara, Lena and Yenisey River basins and the Lake Baykal region. The 1880-87 excavations by N. I. Vitkovskil, the author's in 1927 and other, recent, investigations, especially those by A. P. Oklad-nikov and F. G. Debets are discussed. Reconstructions of the human face from cranial finds (measurements are tabulated) are attempted showing the existence of European and Mongoloid races.

chronology of neolithic cultures, at variance with that of Okladnikov, is suggested. A map (p. 255) shows the possible migration routes of various races, including Lappoids and Mongoloids, to European Russia Copy seen: DLC.

45077. GERBODE, FRANK LEVEN ALBERT, 1907—, and others. Liver circulation in general hypothermia, 1; effect of cooling upon oxygen saturation and electrolytes in hepatic blood. (Stanford medical bulletin, Feb. 1956. v. 14, no. 1, p. 57–59, tables.) 8 refs. Other authors: I. A. da Costa and J. W. Rateliffe.

Account of investigations on O<sub>2</sub>-saturation, sodium and potassium concentrations in blood from the aorta, inferior vena cava, portal vein and hepatic vein of dogs made hypothermic to 25° C. The liver utilized oxygen and did not show hepatocellular hypoxia; O<sub>2</sub>-saturation of hepatic vein blood was higher in hypothermia than at normal body temperature.

45080. GERDEL, ROBERT WAL-LACE, 1901-, and M. DIAMOND. White-out in Greenland. Wilmette, Ill., Dec. 1956. iv, 12 p. illus., diagrs., tables. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. Research report 21.) 9 refs.

Studies in North Greenland during the summers of 1954 and 1955 on white-out phenomena and related meteorological conditions are discussed. Both fog and stratus-type white-outs were encountered frequently at elevations from less than 1,000 ft. to over 7,000 ft. on the icecap during a trip with a tractor-hauled freight swing to a point more than 200 miles east of Thule. Five classes of white-out were discerned: overcast, water-fog, icefog, blowing snow, and precipitation white-outs. Fog-type white-outs impose the most serious handicap on the icecap. More detailed meteorological observations may enable better prediction of the onset of white-out conditions, and artificial nucleation or other means may be developed to control it.

Describes the vacuum process to remove entrapped air and excess water from concrete, for improvement of its physical properties, particularly its strength, density and frost-resistant characteristics. This process accelerates setting, shortens the use of heated forms and coverings, and increases the durability of the construction. The apparatus (air pumps, water separators and collectors, suction end-pipes, etc.), general arrangement of the installation and its operation are described and illustrated. Specific measures to prevent freezing of valves, pipes and other parts under low temperature conditions are outlined: use of hot water or air circulation. Copy seen: DLC.

45084. GERSON, N. C. Sporadie E over North America. (In: Alaskan Science Conference . . . 1953. Proceedings, pub. 1956. p. 115.)

Abstract of paper, covering seasonal and geographical distribution of sporadic E over N. America. A strong maximum occurs during June–July. Monthly summaries during 1949 show that between 25°-50° N. lat., some sporadic E was found over almost every point in the United States. Copy seen: DGS.

Contains a discussion of this family of wolf spiders, a key to nearctic species of the genus Arctosa and a systematic list of 58 (11 new) with synonyms, descriptions and records of specimens. At least seven of the species are native to Alaska, northern Canada and Baffin Island.

Copy seen: DGS.

45087. GESSAIN, ROBERT, 1907 - Statuettes eskimo composites à trois personnages. (Société des Américanistes. Journal, nouvelle série, 1955. t. 44, p. 199–204, illus.) 3 refs. Text in French. *Title tr.*: Composite three-figured Eskimo statuettes.

Describes two unique composite statuettes acquired by the author at Kumiut and Kulusuk in the Angmagssalik district of East Greenland during the French Trans-Greenland expedition in summer 1936. Probably of recent workmanship, the two (aprox. 12 cm. high) driftwood figurines are composed of a female bust with smaller inserted, yet detachable, male and child busts. The two sculptured groups are discussed and compared with a five-headed figure found in Alaska (No. 7230). The facial tattooing of all heads and the deformed, mask-like features of the Kulusuk group are noted; a relationship to the "mors de danse" masked performances is suggested.

Describes location, construction, and maintenance procedures evolved and currently practiced by the Alaska Road Commission. Both preventative and control methods for handling ice have been developed. Where possible, permafrost is avoided, southern exposures are selected, and locations above stream icing elevations are chosen. The most frequent form of icing, that resulting from effluent seepage, can be controlled by ice fencing.

Describes Aug. 1953 microflint finds at the Thyazzi site (approx. 58°50' N. 95° W.) on North Knife River: burins. blades, drills, scrapers, etc. The implements are compared with other microblade sites in the Arctic and sub-Arctic (map p. 224), the absence of polished slate artifacts is noted and a pre-Dorset classification for the North Knife River and Sarqaq (West Greenland) sites is suggested. The question of Indian or Eskimo origin of the Knife River flints is left open. The site is described; also a trip in July up the lower Maguse River in Keewatin (approx. 61°21' N.) where no extensive flint sites were discovered, but recent and early habitation remains, and a few blades recalling those of early sites in Alaska and Mackenzie District were found. Copy seen: DLC.

45106. GIDDINGS, JAMES LOUIS, 1909- "Pillows" and other rare flints. (Alaska. University. Anthropologica papers, May 1956. v. 4, no. 2, p. 117–20,

illus.) 2 refs.

Discusses in turn the functional purpose of three unusual bifaced flint types discovered at various times at Cape Denbigh, Point Hope and Point Barrow (Alaska): "pillow"-like flints flaked on all four edges, a four-pronged implement of translucent chalcedony and a broken, probably bi-pronged, red jasper object. The help of x-ray photography in determining the shape of flints imbedded in the original matrix is stressed and exemplified by radiographs of harpoon heads with inserted side blade flints of the "pillow" variety. 45111. GILES, STUART. Experimental work deals with arctic and antarctic construction problems. (BuDocks technical digest, Nov. 1956. no. 72, p. 7-13, illus., diagrs.) 4 refs.

Contains a discussion of the causes of damage to utility pipelines and buildings in areas of snow, ice, and permafrost. A new protection scheme, termed the Thermal Balance System, is described which utilizes a refrigerated brine piping system as a heat collector. The principle of maintaining the thermal balance of the soil by this system is practical and may help solve some of the difficult construction problems in cold areas.

Copy seen: DLC.

45112. GILES, STUART. A proposed system of building construction on snow, ice, and permafrost. Port Hueneme Calif., Jan. 16, 1956. 10 p. illus., diagrs., graph. map (U. S. Naval Civil Engineering Research and Evaluation Laboratory, Project NY 000 003. Technical note N-239.) 3 refs.

The basic problem in protecting structures supported by permafrost or ice is maintaining the supporting material in its original frozen condition. This report discusses the theory of the thermal balance system which uses refrigerated brine as a heat collector, and some tests and their results. The equipment consists essentially of a brine chiller, a brine circulating pump, and brine tubing installed between the frozen under-surface and fill-type insulation below the structure. A map of Alaska is included showing the estimated month/year requiring mechanical refrigeration to chill the brine. Copy seen: DN-YD.

45113. GILES, STUART. A proposed system of utility piping installation in snow, ice, and permafrost. Port Hueneme, Calif., Jan. 16, 1956. 6 p. illus., diagrs., graphs, map. (U. S. Naval Civil Engineering Research and Evaluation Laboratory. Project NY 550 010-4. Technical note N-261.)

The causes of damage to utility pipelines and buildings in permafrost, snow, and ice areas are outlined, and the results of laboratory investigations of a new method of protection are reported. method is the Thermal Balance System, which uses piped regrigerated brine as a heat collector. The equipment consists essentially of a refrigeration machine, a brine-circulating pump, and a system of brine pipes installed outside the insulation of hot-water or steam mains, or between the frozen soil and fill-type insulation below the floor of buildings. The study showed that the principle of maintaining the thermal balance of soil with a brine system is practical, and may solve some of the more difficult construction problems. Data are given on heat losses from steam pipes and heat gains by the brine with varying pipe arrangements, and the annual settlement of a building on ice. A map of Alaska showing the estimated months per year requiring mechanical refrigeration for chilling brine for the Thermai Balance System is included.

45114. GILL, JOHN CHARLES, 1918—. Geology of the Waskaiowaka Lake area, Cross Lake mining division, Manitoba. Winnipeg, King's Printer, 1951. 41 p. 2 illus., fold. map 30 x 33 in., tables. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Publication 50–5.) 5 refs.

Map (scale 1 in.: 2 mi.) covers the area 56°00'-46' N. 9t6°-97° W. Mapping was done June-Sep . 1950. Means of access, topography, and drainage are briefly described. Consolidated rocks, all Precambrian, consist of interbanded sedimentary and volcanic types intruded by numerous masses of felsic to ultramafic igneous rocks. Most rocks are highly metamorphosed and, except for some of the intrusives, are commonly gneissic, Granitization studies are discussed. The entire area has been subject to repeated folding, faulting, and igneous intrusion. Some of the structures are described; also gold and nickel occurrences.

GILLESE, J. P., see Northern affairs bulletin. 1956- in progress. No. 47091.

45117. GILLETT, L. B. Anorthosites and syenites of the Mealy Mountain area, Labrador. (Canadian mining journal, Dec. 1956. v. 77, no. 12, p. 91.) Abstract of unpublished M. Sc. thesis presented to McGill University, 1956.

In the western Mealy Mts. (53°20′ N. 59°30′ W.) anorthosite consists of coarse gray andesine or labradorite grains rich in unmixed material. A yellowish-weathering green syenite consisting of an unmixed intergrowth of sodic and potassic feldspars separates the anorthosite from granitic gneisses. The syenitic and anorthositic magmas were differentiated from one another while still chiefly liquid.

Results of a survey carried out during ten summers (1944-55) covering most of the Scandinavian mountain range from the Voss-Vik Mts. in the south to Varanger Peninsula in the north (cf. text map). Methods (sociological analyses of quadrates 1/4 m.2) are explained and the sociological classification is discussed. Tabular analyses of various plant communities are presented and discussed (p. 35–400). A précis of the snow-bed communities is given with dominant plant forms (table 64). The alliances are grouped in relation to three principal ecological factors which are decisive for the composition of the plant communities, viz. duration of snow cover, lime content of the soil, and supply of water. Copy seen: DLC.

45133. GJÆREVOLL, OLAV. Problems of plant distribution in the White Mountains in central Alaska. (In: Alaskan Science Conference . . . 1953. Proceedings, pub. 1956, p. 159–62.)

Author spent summer 1953 in the White Mts. (65°15" N. 146° W.) and Alaska Range analyzing plant communities and undertaking a floristic study. Species found (listed) were mostly circumpolar; several had not been known previously in interior Alaska or known in only a few localities. Geology of the White Mts. is varied, limestone areas being of greatest interest. Most limestone plant communities belong to the heath type; rockslide communities also exist. Species composing both limestone and granite communities are noted, and comparisons made with Scandinavia. New records fill gap in distributional area between the arctic coast-Bering Strait and the Yukon. Copy seen: DGS.

45135. GJELSVIK, TORE. Pre-glaciale forvitringsfenomene i kopperforekomster i den syd-vestlige del av Finnmarksvidda. (Geologiska föreningen, Stockholm. Förhandlingar, 1956. bd. 78, nr. 487. häfte 4, p. 659–65, 4 illus., text map.) 5 refs. Text in Norwegian. Summary in English. Title tr.: Pre-glacial weathering in copper deposits in the southwestern part of the Finnmark expanse.

Oxidation-cementation zones of bornite-chalcopyrite deposits, occurring in a great breccia in the southwest part of Finnmark, northern Norway, are described. The supergene minerals are: chalcocite, covellite, malachite, chrysocolla, chalcedone, limonite, and chlorite. The rare deposits are related to copper deposits in the Norrbotten district of northern Sweden in which similar oxidation zones are also found. Reasons for the preservation are briefly discussed.

\*\*Copy seen: DGS.\*\*

45136. GJESSING, GUTORM, 1906—. Fangstfolk; et streiftog gjennom nordnorsk førhistorie. Oslo, H. Aschehoug & Co., 1941. 142 p., illus., plates. Text in Norwegian. *Title tr.:* Hunters; a foray through north Norway's early

history.

Based on miscellaneous lectures at the Tromsø Museum during 1936-40, this book is concerned mainly with demonstrating that early man in northern Norway had arctic rather than Scandinavian culture, as is true to large extent today. Hunting, always the dominant occupation, has also dominated the culture of the various ages. Differences in early coastal and interior Lapp tribes and the influx of Norwegians and Finns in both locations, raise questions of racial origins and purity. Specific topics treated in the eight chapters include: the first and later hunting folk; the late stone age finds at Traena; the arts and skills of hunters; the present people; the boat and its early development without wood; the coming of the south Norwegian and the introduction of agriculture; and cultural and economic changes in Viking times when whaling and sealing began in the Arctic and exploration extended as far as the province of Perm in Russia.

Copy seen: DLC.

45137. GJESSING, GUTORM, 1906— Krigen og kulturene; den kvite mann og naturfolkenes krig. Oslo, Gyldendal, 1950. 136 p., 42 refs. Text in Norwegian. Title tr.: Conflict and culture;

the conflict of the white man and native

people.

In an attempt to explain recent ethnographic and sociologic thinking on the problems of colonial peoples, certain culture traits of Eskimos, Lapps, and other tribal groups are contrasted with what is known as western civilization, cf. p. 74, 78, 102, 106, etc. In his efforts to raise native living standards, the white man sometimes set intolerant goals over the preservation of the good in colonial cultures. Need is stressed for social sympathy, and respect for native rights and cultures.

\*\*Copy seen:\*\* DLC.\*\*

45138. GJESSING, GUTORM, 1906-

Mennesket og kulturen. Oslo, Gyldendal Norsk forlag, 1953. 2 v.: 297, 362 p., illus., plates. 28 refs. Text in Norwegian. *Title tr.:* People and culture.

In v. 1, "A comparative ethnography," writer appraises ethnographic research, its shortcomings, difficulties, and values; relates culture to the natural conditions under which it arises; criticizes some features of western culture, challenges the idea of primitive minds, and the association of race and culture. He discusses in turn, home and dress, occupations, wanderings of tribal groups, and the relationships within groups in all forms of family and social life; with reference throughout to arctic among other peoples.

Vol. 2, a regional study entitled, "Culture forms," deals with northern cultures in chap. 4, including the Netsilik Eskimo (p. 271-87), a group of the nomadic Lapps of northern Norway (p. 287-304), and the Yakut herders in northern

Siberia (p. 304-318).

The section on archeological forms and chronology (p. 89-139), distinguishes cultures from early stone age to the Middle Ages. Traena finds are compared to tribal materials from other locations in Finnmark and Nordland, Siberia, and North America. Discussion of hunting people on Traena (p. 140-58), includes reference to a whalebone hut and tent construction type that is unique to Lapps and still in use (cf. No. 30372), and compared to Eskimo use of whalebone construction near Bering Sea (No. 12177). The present north Norwegian people are seen as a complex blending of groups, varying in origin, time, culture, and effect. Copy seen: DLC.

45140. GLAZOV. A. N. Ispol'zovanie radioaktivnykh izotopov v praktike inzhenernykh izyskaniľ. (Gidrotekhnika i melioratšifa, Sept. 1956. t. 8, no. 9, p. 13–19.) 14 refs. Text in Russian. Title tr.: The use of radioactive isotopes in practical engineering research.

In the broad application of isotopes in the U.S. S. R. (in building machinery, in biology, medicine, metallurgy, etc.), their use is extended to geological and hydrogeological surveys including such in the permafrost regions. Theory, apparatus and methods for X-ray radiation and detection, and for evaluation of intensity of this radiation are briefly described and mathematically formulated. Presence of underground water (hydrogen atoms) can be precisely detected regardless of its state (liquid, gas or solid) and evaluated by an instrument calibrated for ice or snow layers and other materials. This method also can be applied in the study of movements of river sediments, water currents, and in location of petroleum and mineral deposits, and for many other purposes. Copy seen: DLC.

Comprehensive study, dealing with the role of cattle breeding in the agriculture and economy of these districts in the middle Lena basin; current methods of upkeep and feeding, calf rearing, herd structure in the kolkhozes, composition with regard to breeds, appearance and productivity as related to racial origin. Conditions of upkeep and feeding are considered, with data on growth and composition of the carcass, weight, seasonal and other fluctuations in milk production, butter content, etc.; and discussion of selection, breeding and feeding. 45142. GLENNEN, EDWARD J. Design and construction in permafrost regions. (*In*: Alaskan Science Conference . . . 1952. Proceedings, *pub*. 1954. p. 16–18.)

Construction problems associated with permafrost and methods developed for solving them are summarized. The procedures used in site selection, and methods for determining the characteristics of soils underlying a building are outlined. Construction techniques used to date in various types of frozen soil are described briefly, including steam thawing of permafrost and consolidation by blasting, removal of the upper soil layer, pilings, and mechanical refrigeration.

45143. GLIDDON, WILLIAM GILBERT C. Investigations into the effects of weather conditions on the friction of sleigh runners on snow. [Montreal, McGill University, 1923.] 25 p. 4 illus, diagrs., graphs, tables. Typescript.

Starting and sliding resistances as well as penetrations were studied for four model sleds with wooden (ash) runners of similar bearing areas but with ratios of runner length to width ranging from 2-30. The sleds were pulled by an electric motor for approximately 40 ft. at speeds up to a maximum of 15 mph. and the pull measured with a dynamometer. Each trial (five) is described and results are tabulated. The friction coefficient is apparently independent of loading for ice or hard crust, where there is no penetration, for the range of loads tested (up to 0.7 lb./sq. in.), and increases with loading for soft snow to some limiting value at a slower rate than the loading. A narrow runner has a slight advantage over a wide one on ice and a decided advantage in soft snow. The resistance increases almost linearly with speed on ice or hard crust, but in soft snow there seems to be an optimum speed, above and below which resistance increases.—From SIPRE.

Contains distributional data on 20 birds, chiefly from Newfoundland and the Gulf of St. Lawrence. The Newfoundland yellow warbler, Dendroica petechia amnicola, from Southampton Island, and the Churchill savannah sparrow, Passerculus sandwichensis oblitus, collected at Reso-

lute Bay on Cornwallis Island, are included. Copy seen: DA.

45147. GODMAN, RICHARD M., and R. A. GREGORY. Soil-site relationships in the climax forest of Southeast Alaska. (In: Alaskan Science Conference . . . 1953. Proceedings, pub. 1956, p. 112–14.)

An estimated 75 percent of the commercial forest is of the climax type (productive growth completed). Method of classifying stands is explained; climax characteristics are noted as indicators of future second-growth yield capacity of the land. Preliminary analysis of 250 plots showed that typical acre has many age classes having little or no correlation with diameter or height. Soil samples in the Ketchikan area, were examined: depth of humus layer, depth of mineral soil, and depth of tree rooting are fairly reliable indicators of site quality.

45154. GOLD, LORNE W., and G. P. WILLIAMS. Dependence of snowfall on temperature. (Nature, London, June 16, 1956. v. 177, no. 4520, p. 1137-38, diagrs.) 4 refs.

Contains critique of C. L. D'Ooge's and M. Bossolasco's findings that maximum depth of snowfall occurred at a daily mean temperature of -11° C. The dependence was checked by analyzing, on a monthly basis, data collected at an elevation of 7700 ft. on Old Glory Mountain (Can.) 1947-55 and at Montreal in 1951-52. Results show that the greatest amount of snow is likely to come from clouds at temperatures between

-11° C. and -20° C. The majority of snow crystals were irregular assemblages of columns and plates. Conclusions drawn on the basis of details in the observed distributions are speculative due to the difficulty in estimating temperature of formation of the snow and the inconsistency of this temperature throughout a snowfall.

45155. GOLD, LORNE W. New snow and ice research laboratory in Canada. (Journal of glaciology, Mar. 1956. v. 2, no. 19, p. 635-37, 2 illus., diagr.)

Two cold rooms and associated refrigeration equipment were placed into operation in July 1954 by the National Research Council of Canada. The room for cold weather building research is not described in any detail. The snow and ice cold room measures 22 ft. 7 in. x 18 ft. 11 in. x 11 ft. 9 in. Ventilation is provided at the rate of 30 cu. ft./min. The refrigeration load for both rooms is carried by three identical sets of 2-stage, 30-hp., direct-expansion compressors employing Freon 22 refrigerant. Air circulation and area layout in the snow and ice room are described. The initial research is concerned with measuring the ultimate strengths of ice in tension and compression, and the influence of temperature and loading rate.-From SIPRE. Copy seen: DGS.

45156. GOLD, LORNE W. On the relation of snow to meteorology. Montreal, McGill University, Sept. 1952. 4 p. l., 64 l. illus., diagrs., map, tables. 20 refs. M. S. thesis.

The results of statistical and field investigations in 1951–52 on the relation between snow-crystal types and meteorological conditions are reported in detail, and the methods of study are described. General theories on snow crystals, nucleation, and clustering are reviewed. Observations of crystal types and airmass analysis indicate that a relationship exists between the precipitation arriving at the ground and conditions of initiation and growth of precipitation aloft, the structure of the crystals being dependent on the temperature of the cloud.

Copy seen: CaMM.

45157. GOLD, LORNE W. The strength of snow in compression. (Journal of glaciology, Oct. 1956. v. 2, no. 20, p. 719–25, text map, graphs, tables.) 8 refs.

Based on data obtained with the Na-

tional Research Council of Canada Snow Hardness Gauge during the snow survey conducted in Canada since 1947. Data (collected at Resolute, Aklavik, Whitehorse, Churchill, Moosonee, and Goose Bay, among other places) are analyzed and related to several parameters. The hardness value is a reasonable measure of the ultimate strength of snow in compression which cannot be accurately determined except by direct measurement. The mean logarithm of this strength property is dependent on the snow density and to a lesser extent on the temperature and crystal size. The indefinite relationships involving the strength are due to the bonding between snow grains which changes with time as a result of thermodynamic forces.-From SIPRE.

45159. GOL'DENBLAT, I. I., and others. O snegovykh nagruzkakh po stroitel'nym normam i pravilam. (Stroitel'nafa promyshlennost', June 1956. t. 34, no. 6, p. 25-27, diagrs., graph.) Refs. Text in Russian. Other authors: B. G. Korenev and A. M. Sizov. Title tr.: Snow loads according to the building standards and regulations.

Contains a general analysis of the building code on snow loads developed by the Central Scientific Research Institute of Industrial Construction, on the basis of ten years' observations of structural deformations in various regions. Snow accumulation depends upon the roof slope, projecting structures such as chimneys, ventilation vents, parapets, roofs of adjacent buildings, etc., and upon the velocity and direction of snow fall, also upon some other factors. Analysis of structural stresses was made also without consideration of partial snow removal from the roof, in view of the importance of the increasing density of old snow. Variation in maximum snow load allowed

by the code according to geographic location was also taken into account.

45160. GOLDSCHMIDT, VERNER. Grønlandske rets- og moralbegreber under omstøbning. (Grønland 1953, hefte 6, p. 209–215, illus.) Text in Danish. *Title tr.:* Greenlandic conceptions of justice and morals in the melting-pot.

Discusses some spheres where old Greenlandic ideas are disappearing under the impact of the new civilization. Formerly no blame was attached to premarital intercourse, or having illegitimate children (204/thousand in 1948): survival was of prime importance, children essential. This attitude is slowly changing with a money superseding a hunting economy. In the old Greenland, there was no need of mutual agreements for cooperation, hence no tradition among Greenlanders for keeping promises. With modern economic development, division of labor, mutual dependence, etc., this circumstance has become a problem.

45162. GOLDTHWAIT, RICHARD PARKER, 1911—. Meteorology of the Nunatarssuak area. (In: U. S. Army. Transportation Corps. Final report, Operation Ice Cap 1953, pub. 1954. p. 131–38, diagrs.)

The results of observations during June-Sept. in this area near Wolstenholme Fiord, northwest Greenland; wind velocity, air temperatures, storms, cloud conditions, incident radiation, and relative humidity are graphed and discussed in relation to melting, summer clothing requirements, and travel and flight conditions. Winds both on and off the icecap were favorable for point-to-point flight only on 40 percent of the days studied. Temperatures followed longer high and low periods with good correspondence on and off the icecap, being

lower over the icecap due to the cooling effect of snow. Melting and slush, producing avalanches and then pools, increased rapidly from June 24-July 9 in the first warm spell. Most effective melting and the highest run-off were induced by a cool rain (with a sp. heat of 1.01) in early Aug. Low wind velocity, low cloud cover, and high incident sky radiation all correlated in part with temperature and thus contributed indirectly to melting.—From SIPRE.

Various methods are described for protecting different crops against frost. Average duration of frost-free periods per year and critical temperatures for crop damage are tabulated for wheat, corn, potatoes, cucumber, melon, squash. Regional protective measures for various crops are indicated (schematic map); they include microclimatic consideration of seeding and harvesting at specified

times, seeding of frost resistant varieties, protection from cold wind, covering, smudges, open warming, etc.

45172. GOLUBEV, GLEB. Tok v okeane. (Znanie-sila, Feb. 1956, no. 2, p. 46-48, illus., col. plate.) Text in Russian. *Title tr.:* Electric current in the ocean.

Popular account of investigations of fish migration in relation to electrical currents of the seas and terrestrial magnetism, carried out by A. T. Mironov in Barents Sea in 1933–46. Fishes are attracted by the positive and repelled by the negative electrode; the periodicity (10–12 years) of good herring catches in Barents Sea coincides with that of sun spots. Studies of terrestrial magnetism by L. A. Korneva are noted; she devised a laboratory experiment explaining the location of the magnetic poles.

45176. GON'SHAKOVA, V. I. Nekotorye termicheskie i rentgenostrukturnye dannye o palagonite v palagonitovykh mindalekamennykh diabazakh zapadnol chasti Vilūliskol vpadiny. (Akademiß nauk SSSR. Izvestiß, seriß geologicheskaß, Apr. 1956. god 21, no. 4, p. 109–116, tables, graphs.) 5 refs. Text in Russian. Title tr.: Some thermal and X-ray characteristics of palagonite in the palagonitic amydaloidal diabases of the western part of the Vilyuy depression.

Studies involving thermal and optical characteristics of minerals of the palagonite group are reviewed, including chlorite and chlorophaeite. The optical and chemical properties as indicated by color and coefficient of refraction are tabulated. The exothermic and endothermic effects on heated palagonites and chlorites are very distinctly illustrated on four thermograms and the optical characteristics on the roentgenogram (x-rays). Similar investigation of hisingerite showed that its properties, composition and ther-

mogram are distinctly different from minerals of the palagonite group.

45177. GON'SHAKOVA, V. I. O profavlenii trappovogo vulkanizma v poslenizhnefürskoe vremfa na Sibirskol platforme. (Akademiß nauk SSSR. Doklady, Apr. 1, 1954. nov. ser., god 22, t. 95, no. 4, p. 857-59.) Refs. Text in Title tr.: Indication of trap volcanism on the Siberian plateau after

the lower Jurassic age.

Denudation of banks on the upper course of the Nizhnyaya Tunguska River (near confluence of the Verkhnyaya Krivaya and the Girendau) was studied in view of indication of the volcanic character of the Siberian plateau during or after the Jurassic period. Studies of sandstone, slate, diabase and diabaseporphyrite in contact with the trap indicate that they are strongly enriched with iron. Microscopic analysis of diabase, in contact with skarnic types of rocks, indicates the hydrothermal activity of the trap and appreciable content of palagonite and biotite. Study of skarn rocks on the bank of the Vilyuy River (below the Akhtaranda) also indicates among grossularite and veluites a new unknown mineral, Akhtarandite.

Historical review of hydrogeological research in Russia from the 17th century, with emphasis on that during the last 40 years. Recent studies on ground water are surveyed (p. 219-24) in relation to permafrost regions (zones of fossil ice, continuous permafrost, permafrost with thawed spaces, and permafrost islands). Railroad construction in Siberia at the end of the 19th century and extensive construction in permafrost areas after 1925 resulted in the development of permafrost study from the engineering viewpoint, and a new science: permafrostology. The Commission (from 1930), Committee (from 1936), and Institute (from 1939) of Permafrostology of the Academy of Sciences of the U.S.S.R., numerous permafrost stations, and six All-Union conferences on permafrost during the prewar period aided in the development of the new science.—From SIPRE.

Describes drift of station North Pole-4 from 80°30' N. 176° W. to vicinity of 86° N. in April-Dec. 1955, over 600 miles. Bottom soundings, ocean current, aerological, solar radiation, and seismographic observations, are sketched, fauna and flora in the region of relative inaccessibility, problems of ice-melting and water drainat the permanent camp site, etc., are discussed. Small sketch map indicates tracks of stations North Pole-3, 4 and Writer relieved Evgenil 5 in 1954-55. Tolstikov as leader on North Pole -4 in Copy seen: DLC. Apr. 1955.

45186. GORDON, S. M. Primenenie teodolita dlîa opredeleniâ vysoty sezonnoï snegovoï linii v gorakh. (Meteorologiâ i gidrologiâ, Apr. 1956, no. 4, p. 54-57, table, graph, diagr.) Text in Russian. Title tr.: Use of the theodolite for determining the elevation of the seasonal snow line in mountains.

The technique and method of computation are described. Formulas for calculating the relative error stemming from the vertical angle of inclination of the mountain in relation to the orienting point are given. The method was tested in 1954, showing good agreement with hydrometeorological determinations. These data were used to compute the mean daily river discharge of the region investigated (not specified), and the results were compared with those obtained (1950) by the approximate method of N. G. Dmitriev. Daily melting was estimated at 5 mm./°C. and the temperature gradient as 0.64° C./100 m. Data are graphed on the relation between total runoff and snow-line elevation, air temperature, and precipitation. The agreement between the observed discharge value and that computed with the Dmitriev method was poor; the theodolite method however, showed better agree-Copy seen: DLC. ment.

45201. GRAHAM, R. C. Trans-oceanic aviation services. (Weatherwise, Apr. 1956. v. 9, no. 2, p. 51-53, illus.)

Canada has provided meteorological service to trans-oceanic aviation continuously since 1937. Its importance has increased with the start, in 1954, of commercial trans-arctic flights from the North American west coast to Europe, and with greater volume of traffic on other routes. Brief description of forecasting procedure is given.

**45202. GRAINGER, EDWARD HENRY, 1926**- . The "Calanus" in Foxe Basin, 1955-6. (Arctic circular, 1956. v. 9, no. 3, p. 41-43.)

Reports a year-round study (from Sept. 1955) in the Igloolik region, northern Foxe Basin. Primary interest was walrus, but seals, fish, plankton, and benthos were also studied and oceanographic observations made. One collecting station was maintained throughout the year to study annual plankton and sea-water cycles. Author and Capt. H. Andersen wintered aboard the Calanus (quarters described) at Turton Bay, Igloolik Island (69°22'7" N. 81°44'3" W.). Winter hunting of walrus on the pack ice by Foxe Basin Eskimos is discussed, stressing skills and group effort involved.

45203. GRAINGER, EDWARD HENRY, 1926— . Echinoderms of Ungava Bay, Hudson Strait, Frobisher Bay, and Cumberland Sound. (Canada. Fisheries Research Board. Journal, 1955. v. 12, p. 899–916, illus. tables.) 33 refs.

Description of 26 species of echinoderms collected between 1947 and 1952 by the *Calanus* expeditions. Fifteen of the species are new records for the area. Locations and depth of finds, geographic distribution, earlier records, morphology and anatomy, similarities with related forms, etc., are dealt with.

Lists 89 stations where biological or oceanographic observations or collections were made by the Calanus in Hudson Bay, western Hudson Strait and Ungava Bay, during the 1953 and 1954 seasons. Location, geographic position, depth in meters and kind of work done is stated for each station. Copy seen: DI.

45205. GRAINGER, J. N. R. Effects of changes of temperature on the respiration of certain Crustacea. (Nature, *London*, Oct. 27, 1956. v. 178, no. 4539, p. 930-31, illus.) 10 refs.

Account of experiments with several kinds of crustaceans and their eggs. A transfer to lower or higher temperature caused an immediate overshoot in O2-consumption, followed by minor oscillations and final stabilization with the new condition. No such overshoot was observed in CO2-production. The phenomenon is explained as an expression of the steady-state condition.

Magnetite deposits on an island approx. 60°12' N. 152°42' W. occur in contactmetamorphosed volcanic and sedimentary rocks near their contact with a quartzdiorite batholith, which underlies large areas of the adjacent Aleutian Range. The deposits are pyrometasomatic in origin and probably are localized by northeast-trending fractures. The eastern deposit is a low-grade disseminated deposit occurring in hornfels. The western deposit occurs as a massive lens of magnetite and garnet, . . . may contain about 75 percent magnetite,-From author's abstract Copy seen: DGS.

45207. GRANTZ, ARTHUR, 1927—. Possible origin of the placer gold deposits of the Nelchina area, Alaska. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1807.)

Abstract of paper presented at the Seventh Alaskan Science Conference (AAAS), Juneau, Sept. 27–30. Author suggests that Eocene continental gravels inferred to have covered most of this area (61°57′ N. 146°26′ W.) in late geologic time contained concentrations of placer gold which were reworked during late Pleistocene and Recent to form present placers. Lack of intrusive rocks of gold-bearing type, present distribution of placers, and characteristics of the pieces of gold are presented as support for theory.

English translation by E. R. Hope pub. by Canadian Defence Research Board, Directorate of Scientific Information Service, Ottawa, June 1956 as its T218R

(3 p.) Copy at CaMAI.

The age of hydrolaccoliths is discussed on the basis writer's find, on the Anadyr' plateau near Lake Chirovoye in 1952. of one of these mounds 15-20 m. high with traces of an ancient campsite. Objects from the latter were described by A. P. Okladnikov (No. 31087) as of neolithic and early bronze age, hence the hydrolaccolith formed 2,000 or more years ago. Hydrolaccoliths, or icing mounds, known as pingos in Alaska or bulgunniakhi in Yakutia, are associated with permafrost and long-period freezing in valleys with underground rivers and lakes. They are also formed in several areas of peat soil as a seasonal phenomenon. Copy seen: DLC. GRAY, BOB PARVIN, see Behlke, C. E., and B. P. Gray. A study of floods on glacial streams. 1956. No. 43923.

45210. GRAY, IRVING, 1920—, and others. Effect of hypothermia on metabolism and drug detoxification in the isolated perfused rabbit liver. (In: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia... symposium, Oct. 1955, pub. 1956. p. 226–34; illus. tables.) 19 refs. Other authors: R. R. Rueckert and R. R. Rink.

Following a description of apparatus designed for, and used in experiments with perfused liver, the effect of hypothermia as studied with these apparatus, is discussed. Respiration, metabolism and its ability to conjugate morphine and thiopental, detoxification of these two drugs, and bile formation are included.

Account of investigation of mean temperatures of various body regions in tropical-bred, conscious rats and their responses to cold-exposure. In the latter case, a rapid temperature stabilization was observed. Ganglion blockade or adrenalectomy affected only slightly resistance to cold; but a combination of both or adrenergic blockade seriously impaired it. Pentobarbitone sodium had a similar effect, due in part by inhibition liver function. Copy seen: DNLM.

# British Parliamentary Papers on Arctic Expeditions

Nos. 45212-45257 describe documents on some of the British Government expeditions in the North American Arctic in the 19th century. Most of these documents originated in the Admiralty, were presented to one or both Houses of Parliament in connection with an inquiry, and were published in its (their) sessional papers. Many were also issued separately. A few concern early attempts on the Northwest Passage; most deal with the midcentury Franklin search efforts; a few concern Nares' abortive attempt on the North Pole. The documents are largely field records of participants in the expeditions or their evidence at hearings, etc., and record their activities and the regions explored in more explicit detail than the narratives and scientific papers of these expeditions published for the general public. For a large part of the Canadian Arctic, they have been the most extensive source of information in print, and for sections of it, until recently, the sole source. The information is difficult of access, however, due to the character and complexity of the documents, lack of indexes, etc. In Nos. 45212-45257 and the index at the end of this volume, these documents are described and indexed for their geographic content, data on environmental conditions, expeditionary health, and organization; some essentially administrative matter is indicated but no attempt made to trace history of exploration. Geographic coordinates of most of the cited localities are given in Northwest Territories and Yukon, a provisional section of the Gazetteer of Canada, prepared by Canadian Board of Geographic Names, Ottawa, 1958. These documents, or most of them, are available in the libraries of the Canadian Department of Northern Affairs, Scott Polar Research Institute, Cambridge, England, Royal Geographical Society, London, and in sessional papers files maintained by the Library of Congress, New York Public Library, Canadian Parliamentary Library, among others; they are also available in microprint from Readex Microprint, 115 University Place, New York 3, N. Y. The Arctic circular, v. 8, no. 3, 1955, published a preliminary guide to these documents by Dr. Andrew Taylor,\* who also prepared the abstracts which follow.

The documents have been indexed in depth by Dr. Taylor for the Canadian Dept. of Northern Affairs and National Resources, and this index, an extensive card file, is available for use in the Northern Affairs Library, Northern Research Co-ordination Centre, Ottawa.

## 45212. GREAT BRITAIN.

A bill for more effectually discovering the longitude at sea, and encouraging attempts to find a Northern Passage between the Atlantic and Pacific Oceans, and to approach the Northern Pole. Ordered by the House of Commons to be printed, 9 March 1818. 9 p. (Great Britain. Parliament. House of Commons. Sessional papers, Bills public 1818, v. 1, no. 99)

First reading of a bill to provide a system of rewards (amounts not stated) for: accurately finding longitude at sea; accomplishing the Northwest Passage; and approaching within a degree of the North Pole. The bill was enacted May 8, 1818 as 58 Geo. III, c. 20; it provided rewards for finding longitude, of £5,000, £7,500, and £10,000 according to accuracy achieved, with minor rewards for related experimental work of £1,000 annually; for a Northwest Passage, £20,000 was offered; and for approaching the North Pole, £5,000.

#### 45213. GREAT BRITAIN.

Report from Select Committee on the Expedition to the Arctic Seas, commanded by Captain John Ross. Ordered by the House of Commons to be printed, 28 April 1834. 40 p., fold. col. map. (Great Britain. Parliament. House of Commons. Sessional papers, Reports from committees, 1834, v. 18, no. 250) Previously listed as No. 6107 of Arctic Bibliography.

Report (p. 3-7) of committee appointed to investigate Ross's second expedition in search of a Northwest Passage, to decide if he should be remunerated, and to what amount. Government support of this expedition had been refused, and Felix Booth contributed about £18,000 towards its cost. A letter from Ross written in Baffin Bay (Sept. 1833) giving an account of the expedition's activities from 1829 to 1833, is included. Value of its investigation of Prince Regent Inlet as a potential Northwest Passage, the addition of about 700 miles of new coastline, and the discovery of the North Magnetic Pole, are recognized, and reward of £5,000 is recommended. Appended minutes of evidence (p. 9-38) include biography of Ross; information on costs of the expedition; its scientific work in terrestrial magnetism, meteorology, astronomy, auroras, etc. (p. 12, 16, 19-20, 23-24, 29-30); on camping equipment, diet, health of crew, etc. (p. 12, 13); on use of paddle-wheel steamers, survival following shipwreck (p. 17–18); on differences in elevation between eastern and western sea levels of Boothia Isthmus (p. 27, 32). Evidence was given by John Ross, J. C. Ross, Francis Beaufort, F. Booth, J. G. Children (Royal Society), etc.

Map shows voyages into the arctic regions from 1818, including tracks of Beechey, Franklin, Richardson, Lyon, Parry, John Ross and Buchan.

Arctic expedition. Return to an address of the Honourable the House of Commons, dated 26 May 1848, for a Copy of the orders from the Lords Commissioners of the Admiralty, under which Captain Sir James Clark Ross has proceeded on an expedition in search of Captain Sir John Franklin. Ordered by the House of Commons to be printed, 7 June 1848. 4 p. (Great Britain, Parliament. House of Commons. Sessional papers, Accounts and papers, 1847–48, v. 41, no. 386)

On termination of the period for which Franklin's expedition of 1845 had been victualled, J. C. Ross was given command of two vessels, HMS Enterprise and Investigator (Capt. Bird), with orders, dated May 1848, to search the shores of Lancaster Sound and Barrow Strait for traces of the Franklin expedition. lowing examination of Wellington Channel, the ships were to be established in winter quarters on north Somerset Island. In the spring, Ross was to examine the west coast of Somerset Island and Boothia Peninsula southward to connect with his survey through Boothia Isthmus in 1831. By steam launch, in early summer 1849, Ross was to establish communications home through whalers in Lancaster Sound. Instructions cover also his projected search farther west, in the vicinity of Banks Island and of Melville Island. particularly with regard to his contacting Richardson's expedition at Cape Parry or Cape Bathurst on the north continental Copy seen: DLC.

#### 45218. GREAT BRITAIN.

Arctic expedition, North Star. Expense of the estimates of the equipment of Her Majesty's ship North Star; and copy of minute of the Board of Admiralty respecting the equipment of the North Star, for the purpose of taking out a supply of provisions, &c., for the crews of Her Majesty's ships Investigator and Enterprise, employed on an expedition to the arctic regions. Presented to Parliament by Her Majesty's command. Ordered by the House of Commons to be printed, 23 March 1849. 2 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1849, v. 31, no. 152)

Estimated costs of equipping the North Star are itemized as ship repairs, wages, victuals, ordnance stores, provisions, stores and coals, etc. for the Investigator and Enterprise. Board of Admiralty minute of Mar. 23, 1849 is added: this resupply operation is designed to forestall Capt. J. C. Ross's returning one of his vessels, the Investigator, to England.

papers, 1850, v. 35, no. 107) Contains reports of Franklin search expeditions in the Eastern Arctic under Capt. J. C. Ross (Enterprise and Investigator), and by Capt. James Saunders (North Star), as well as reports of whaling voyages (Truelove and Advice) to Baffin Bay, Lancaster Sound and Prince Regent Inlet; also, reports of search expeditions in the Western Arctic under Kellett (Herald), Moore (Plover) and Collinson (Enterprise) by way of Bering Strait, including Pullen's boat voyage along the north coast of Alaska to the Mackenzie River; also, proposed expeditions to Bering and Barrow Straits, including proposals by M'Cormick, Osborn, Penny and King, together with Lady Franklin's correspondence with volunteer

searchers; also, rewards for successful Franklin searchers, and proposals to use

Eskimos and dogs in the search. 1. Eastern Arctic expeditions: The Finterprise and Investigator (Capt. E. J. Bird), commanded by Capt. J. C. Ross, sailed from Upernavik across Baffin Bay to Pond Inlet, through Lancaster Sound to winter quarters at Port Leopold on Somerset Island, July-Oct. 1848; spring sledge trip with M'Clintock west along the north coast of Somerset Island, and south into Peel Sound, sledge parties into Prince Regent Inlet and north across Barrow Strait, and return voyage of Ross and the Enterprise to England, Nov. 1849 (p. 58-64). Instructions and progress reports of the North Star (Capt. James Saunders) ordered to the Lancaster Sound area to resupply Ross's two vessels for Voyage of the whaler 1850 (p. 64-70). Truelove in Baffin Bay-Lancaster Sound 1849, cf. fold. map at end, and natives' report of ships in Prince Regent Inlet; voyage of the whaler Advice (Capt. Penny) in 1849, an abortive attempt to enter Lancaster Sound, but landing a depot on Wollaston Island, which is described (p. 70–74). Proposed expedition to Barrow Strait, with reports and comments 1849–1850, by Rear-Adm. Sir Francis Beaufort, Capt. W. A. B. Hamilton, J. M. Hamilton, Capt. W. E. Parry, Capt. George Back, Capt. F. W. Beechey, Dr. John Richardson, and Col. Edward Sabine (p. 98–111); Capt. John Ross's plan for an expedition with three small vessels to the Barrow Strait area, supplies listed (p. 111–20); this plan did not materialize.

2. Western Arctic expeditions: Progress report by Dr. John Richardson of journey in 1848 down Mackenzie River, east along north continental coast past Dolphin and Union Straits to Coppermine River, returning to Fort Confidence on Great Bear Lake by way of the Kendall River, including game, scientific observations and instructions to Rae (p. 1-8). Kellett's report (p. 9-43) of voyage of the Herald May-Oct. 1849, by way of Kamchatka through Bering Strait to Kotzebue Sound. noting whales, seals and walrus, discovery of Herald Island (p. 18), coastal voyage from Chamisso Island to Wainwright Inlet (p. 41-43): incuding Moore's report of wintering of the Plover on the Asiatic coast (p. 35-36), and voyage along the northwest coast of Alaska, with exploration of Eschscholtz Bay and Buckland River (p. 38-39); also Lt. W. J. L. Pullen's boat expedition from Wainwright Inlet via Pt. Barrow to the Mackenzie in 1849, covering proposal, instructions, Pullen's progress reports (p. 22-30), and Martin's report (p. 31-33) of the return party with account of mutiny. Hudson's Bay Co. correspondence on Pullen (p. 47-55) and on Rae (p. 56-57). Proposed expedition to Bering Strait (p. 74-82), with comments and recommendations by Rear-Adm. Sir Francis Beaufort, Captains W. E. Parry, J. C. Ross, F. W. Beechey, George Back, and Dr. John Richardson, with (p. 75-77) sketch and description of Parry's proposed sledge design. This expedition was sent out, Capt. R. Collinson in command with the Enterprise, and M'Clure, the Investigator. Instructions are given, and selection of Miertsching as interpreter is discussed (p. 82-89); and counsel offered (p. 89-96) by Parry on ice navigation, winter quarters, the Northwest Passage; by Beechey on ice navigation in Beaufort Sea, natives, etc.; and by Richardson on attacks by natives, together with his comments on Eskimos, Chukchis, Indians, the Colville River mouth, Hudson's Bay Co. posts on the Mackenzie River, articles of trade, cold weather diets, cleaning bedding, etc.

3. Search proposals: Dr. Robert M'Cormick's (p. 121-27) for boat expedition to search Jones and Smith Sounds, and Wellington Channel: Lt. S. Osborn's (p. 128-32) for overland journey to mouth of Colville River: Capt. Wm. Penny's (p. 133-35) to pursue search of Wellington Channel; and Dr. Richard King's (p. 155-56) to search the estuary of the Great Fish River: Thomas Ward's (now Back) recommendations to utilize Eskimos with dog teams on search (p. 156-57). Correspondence from Lady Franklin, Wm. Snow, John M'Lean and others, on the search for Franklin (p. 137-54), including (p. 143-45, 148-49) rewards offered to successful searchers.

Maps (two, at end) comprise: Chart of Baffin Bay with Davis and Barrow Straits by John Ross and W. E. Parry in 1818-20, showing discoveries of Parry in 1822-23, Capt. Lyon in 1824, Dr. Rae in 1847; track of the whaler Truelove in 1849; inset is an Eskimo sketch map, intended to show the positions of the ships of Franklin and Ross in Prince Regent

Inlet in March 1849.

Chart of the North Polar Sea, corrected to 1849. Copy seen: DLC.

#### 45224. GREAT BRITAIN.

Arctic expedition. Return to an order of the Honourable the House of Commons dated 12 April 1850, for: An account of the charge for the purchase, repair and outfit of the vessels now fitting for the arctic expedition. Ordered by the House of Commons to be printed, 23 May 1850. 2 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1850, v. 35, no. 368)

Contains cost of purchase and refit of the Resolute, Assistance, Pioneer and Intrepid for Austin's expedition, with estimated costs of crews' wages, clothing, provisions, medicines, and of hiring the transport, Emma Eugenia; together with cost of purchase and refit of Lady Franklin and Sophia for Penny's expedition, with estimates of crews' wages, provisions, clothing, medicines, etc.

Copy seen: DLC.

## 45225. GREAT BRITAIN.

Arctic expeditions. Return to an address of the Honourable the House of Commons dated 10 May 1850, for: Copies of instructions from the Admiralty to

Captain Austin, and to any other officers in Her Majesty's service engaged in arctic expeditions, since the date of the last Parliamentary return. Admiralty, 28 May 1850, J. H. Hay, Chief Clerk. Ordered by the House of Commons to be printed, 31 May 1850. 6 p. (Great Britain. Parliament. House of Commons. Sessional papers, Reports and papers, 1850, v. 35, no. 397)

Contains Admiralty instructions, Apr.—May, 1850, to Captains Wm. Penny (Lady Franklin), James Saunders (North Star), and H. T. Austen (Resolute).

## 45226. GREAT BRITAIN.

Arctic expeditions. Return to an address of the Honourable the House of Commons dated 7 February 1851, for: Copy or extracts from any correspondence or proceedings of the Board of Admiralty in relation to the arctic expeditions, including those more recently sent forth in resumption of the search for that under the command of Sir John Franklin. Copies of any instructions from the Admiralty to any officers in Her Majesty's service engaged in arctic expeditions, since the date of . . . Parliamentary papers no. 107 and no. 397 of session 1850; And, copy or extracts from any correspondence or communications from the government of the United States, or from Her Majesty's Minister at Washington, in relation to any search to be made on the part of the United States, or from its territory, for the expedition under Sir John Franklin. Admiralty, 7 March 1851, J. H. Hay, Chief Clerk, Ordered by the House of Commons to be printed, 7 March 1851. iv, 106 p., 2 (Great Britain. fold. maps. Parlia-House of Commons. Sessional ment. papers, Accounts and papers, 1851, v. 33, no. 97)

Contains reports of expeditions in 1849-50 to the Canadian Eastern Arctic commanded by Capt. H. T. Austin (Resolute, Assistance, Pioneer and Intrepid); Lt. E. J. DeHaven, USN. (Advance and Rescue); Cmdr. Charles C. Forsyth (Prince Albert); Capt. Wm. Penny (Lady Franklin and Sophia); Capt. John Ross (Feliz); and Capt. James Saunders (North Star); also reports of expeditions to the Western Arctic commanded by Capt. Richard Collinson (Enterprise), Capt. Henry Kellett (Herald), Cmdr. T. E. L. Moore (Plover), Lt. W. J. S. Pullen and Dr. John Rae (boat expeditions); also

proposals for search expeditions presented by Rear-Adm. J. N. Tayler, and W. P. Snow.

1. Eastern Arctic expeditions: For Capt. H. T. Austin's group, three years' supplies are listed and progress reports (1850) given for the Resolute (Austin) and the Assistance (Ommanney) and their tenders (p. 89-96). For Capt. E. J. DeHaven's expedition sponsored by Henry Grinnell. Congress resolution and official instructions are given (p. 1-4). Cmdr. Charles C. Forsyth's reports on the voyage of Prince Albert (1850) to Lancaster Sound and Prince Regent Inlet (p. 68-70) with report by Ommannev of Franklin relies found Aug. 1850 at Cape Riley, followed by comments of Beechev, Parry, Richardson, Dr. Andrew Clark (microscopic examination). Capt. Peter Richards, and Col. Edward Sabine (p. 70-79). Capt. Wm. Penny gives progress reports (1850) of voyage to Lancaster Sound (p. 80-83). Capt. John Ross gives a progress report to the Hudson's Bay Co. on his voyage (1850) to Lancaster Sound, and investigation of native reports of murder of crews of Erebus and Terror (p. 83-88). Capt. James Saunders recounts the voyage of the supply ship North Star up Baffin Bay to Wolstenholme Sound in 1849, with comment on Eskimos, scurvy, spring break-out, etc. (p. 56-60); and the voyage (1850) across Baffin Bay to Possession Bay, and through Lancaster Sound to Whaler Point and Prince Regent Inlet (p. 60-68), with a depot laid at Wollaston Islands, to supply 100 men for one year (articles listed).

2. Western Arctic expeditions: Capt. Richard Collinson's report on the voyage of the Enterprise and Capt. Robt. M'Clure's on the Investigator to Kotzebue Sound (p. 5-16), and Arbuthnot's journal of ice conditions along the northwest coast of Alaska, Aug. 16-29 (p. 16-18). Capt. Henry Kellett's narrative of the voyage of the Herald 1849-50, by way of Kamchatka through Bering Strait to Kotzebue Sound, coasting to Cape Lisburne (p. 19-21), advice to Collinson on route through Bering Strait and eastward (p. 25-27), with comments on natives, ice conditions, harbors, etc. Cmdr. T. E. L. Moore's narrative of voyage of the Plover 1849-50, with remarks on natives around Kotzebue Sound, spring break-up of ice in the Sound, scurvy and anti-scorbutic diet, depots laid (p. 28-32); instructions from Kellett and a boat expedition in July-Aug. 1850 from Icy Cape to Point Barrow (p. 34-40); medical survey of the Plover (p. 41-42); instructions from Collinson (p. 42). Lt. W. J. S. Pullen's boat expedition eastward along the north coast of Alaska: supplies, etc., progress June-July 1850 (p. 51-56). Dr. John Rae's summer 1849 boat expedition to Dolphin and Union Strait from Fort Confidence (Great Bear Lake) by way of the Dease. Kendall and Coppermine Rivers (p. 45-50), with fishing at Bloody Falls; food supplies, Hudson's Bay Co. arrangements and criticism of proposed expedition (p. 50-52).

3. Franklin Search proposals presented by Rear-Adm. J. N. Tayler (p. 96-99), and W. P. Snow (p. 99-104).

Maps: Baffin Bay with Davis and Barrow Straits, by Ross and Parry, 1818–20, and discoveries of Parry in 1822–23, Lyon in 1824, and Rae in 1847 (at p. 66). Barrow Strait, Prince Regent Inlet &c. with tracks of Prince Albert through Lancaster Sound, and into Prince Regent Inlet (at p. 72).

Copy seen: DLC.

## 45227. GREAT BRITAIN.

Arctic expeditions. Report of the Committee appointed by the Lords Commissioners of the Admiralty to inquire into and report on the recent arctic expeditions in search of Sir John Franklin, together with the minutes of evidence taken before the Committee, and papers connected with the subject. Presented to both Houses of Parliament by command of Her Majesty. London, Eyre and Spottiswoode, 1852. lix, 199 p., 2 illus., 2 fold. maps. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852, v. 50, no. 1435)

Contains results of an inquiry by the Arctic Committee into the thoroughness of Austin's and Penny's search for Frankin in Wellington Channel in 1850–1851, dealing specifically with ice and current conditions in Wellington and Queens Channels and with the discovery of relics of the Franklin expedition in the vicinity of Beechey Island. Evidence was given by members of the expeditions of Austin and Penny, and of Capt. John Ross's 1851 expedition. Natives' reports of the Franklin expedition, comments by Pullen, Richardson, Scoresby and others were presented, also the official instructions given Lt. E. J. DeHaven, and

Capt. James Saunders. Selected topics in the evidence are noted below.

Report of the Arctic Committee (p. iii-vii) commends Penny and Austin, reviews the status of Franklin search, and recommends an expedition in 1852-1853 to the Barrow Strait area, Beechey Island as Appended are the Committee's instructions (p. x); review of Austin's activities, the Resolute (p. xi-xli), including Ommanney's report on the Assistance, scale of provisions, sledge equipment and clothing lists (p. xl-xli); and report of Penny's activities with the Lady Franklin and Sophia, Capt. A. Stewart (p. xlvii-lix), including voyage to Assistance Bay, spring sledging journeys into Wellington Channel, on Cornwallis and Devon Islands and ships' complements. Evidence follows (p. 2-199)

of 30 witnesses, listed p. 1. 1. Capt. H. T. Austin's expedition. Evidence of Capt. Austin: Franklin relics at Cape Riley and Beechey Island (p. 28), sledging activities (p. 32), ice conditions in Wellington Channel, ice navigation (p. 41-42), statement on his journal (p. 113), decision to terminate expedition (p. 39, 145) criticism of M'Clintock (p. 145), instructions from Admiralty (p. 149-50), fate of the Franklin expedition (p. 164-67), including discussion of ice conditions in Wellington Channel, Franklin relics at Cape Riley, Beechey Island and Cape Bowden, etc. Lt. R. D. Aldrich's (Resolute) evidence: ice conditions and ice navigation in Wellington Channel, game (p. 110-113), etc. R. C. Allen: incompleteness of search for Franklin documents, ice conditions in Wellington Channel, tides and tidal currents at Griffith Island, navigation season in Wellington Channel (p. 114-18). Dr. A. R. Bradford (Resolute): journey to Melville Island via Bathurst and Byam Martin Islands, game, Eskimo ruins (p. 106-107); sledge equipment, clothing, provisions, selection of personnel (p. 193-96). John E. Brooman's evidence on 131-32, 196-98). Lt. provisions (p. W. H. J. Browne's evidence: game, ice conditions in Wellington Channel, geological observations at Cape Walker (p. 118-119). Lt. J. B. Cator's evidence: ice conditions in Wellington Channel, game, ice navigation (p. 103-105). Lt. J. E. Elliott's evidence: ice conditions in Wellington Channel, and Franklin relics at Cape Riley (p. 138–39). Lt. F. L. M'Clintock's evidence: ice conditions and navigability of Wellington Channel, and

of Melville Sound south of Melville Island, coasts searched by M'Clintock, tides and tidal currents, Eskimo ruins on Melville Island, game (p. 86-89); physical condition of sledgers (p. 91-93); criticism by Austin (p. 145); detailed report on sledging and equipment for 11-man party on spring journey, with sketch of tent, sledge, lists of gear, clothing, food, notes on packaging, travel, routine (p. 181-91). Dr. G. F. M'Dougall's evidence on examination of McDougall Sound, ice conditions in Wellington Channel, tides, Eskimo ruins, game, etc. (p. 120-22). Lt. G. F. Mecham's evidence on ice conditions in Wellington Channel (p. 139-40). Capt. E. Ommanney's evidence: misunderstandings between Austin and Penny, navigability of Wellington Channel, Franklin relics at Cape Riley, ice navigation (p. 50), living off the land, description Cape Walker (p. 44-59); Adam Beck's report (p. 143-44). Lt. S. Osborn's evidence on ice conditions in Wellington Channel, fauna, Eskimo ruins, ice navigation, magnetic observations on Prince of Wales Island (p. 99-101); sledge equipment, clothing, provisions, etc. (p. 192-93).

2. Capt. Wm. Penny's expedition: Capt. Penny's evidence: navigability of Wellington Channel, discrepancies in surveys of Cornwallis Island, tidal currents in Queens Channel, game (p. 1-12), search of Beechey Island, site of Franklin's winter 1845-46 camp (p. 12, 24-25), decision to terminate expedition (p. 60-62, 144-45), instructions from Admiralty (p. 150-52), living off the land, Eskimos and their migrations (p. 179-81), extracts from journal (p. 199). John Abernathy's evidence: ice conditions in Wellington Channel, tides and currents, and whalers crushed in ice (p. 94-98). Dr. R. A. Goodsir's evidence: ice conditions off north and east coasts of Cornwallis Island, game, tidal currents in Queens Channel, and Eskimo ruins (p. 73-77). Harwood's evidence on steamship in ice navigation (p. 82-83); Donald Manson's evidence on ice conditions, tidal currents and ice navigation in Wellington Channel (p. 77-80); Marshall's evidence on ice conditions, navigability, tides, currents, game, etc. in Wellington Channel (p. 62-66); Ryder's evidence on ice navigation (p. 83-84); Captain Alex Stewart's evidence on ice conditions in Wellington Channel, game (p. 12-14), amendments to evidence (p. 125-26), and exploration of Wellington Channel (p. 145-46). John Stuart's evidence on ice conditions in Wellington Channel, Franklin relies and Eskimo traces at Caswall Tower (p. 80-81). Dr. P. C. Sutherland's evidence on ice conditions in Wellington Channel, ice navigation, game, Eskimo ruins (p. 19-23); ice conditions near Prince Albert Bay (p. 122), and extract from journal (p. 199).

3. Capt. John Ross's expedition. Capt. Ross's evidence on ice and tide conditions in Wellington Channel, on Adam Beck's report of murder of Franklin expedition crews (p. 53–55), and on fate of Franklin's expedition (p. 153–54). Cmdr. C. G. Phillips' evidence on Beck's report, winter quarters of the North Star discovered, and ice conditions in Wellington

Channel (p. 67-70).

Also: Capt. Henry Kellett's statement on the Franklin expedition, ice conditions in Bering Sea, and discovery of Herald Island (p. 168-70). Cmdr. W. J. S. Pullen's brief account of his 1849 boat expedition from Wainwright Inlet to Mackenzie River, ice conditions along the north coast, game, tides, harbors, natives, etc. (p. 127-30); and his second (1850) boat expedition to Cape Bathurst, including ice conditions, and ice navigation in small boats (p. 130-31). Dr. John Richardson's report on wood fragments from north Cornwallis Island, temperature comparison between Assistance Bay and Queens Channel (p. 123-24); on prospects of survival of the Franklin expedition (p. 174-79), including game, sledge equipment, clothing and provisions, flora, snow houses, etc. Also statement of Wm. Scoresby on the Franklin expedition, with comments on ice navigation, dog sledges, sledge boats, steam-powered sledges, etc. (p. 154-64). Official instructions to Lt. E. J. DeHaven, USN (p. xxxvii-xxxviii), and to Capt. James Saunders (p. 152-53).

Maps (two, at end) show coastal regions searched by parties of Austin's and

Penny's expeditions.

Copy seen: DLC.

#### 45228. GREAT BRITAIN.

Additional papers relative to the arctic expedition under the orders of Captain Austin and Mr. William Penny. Presented to both Houses of Parliament by command of Her Majesty. London, Eyre and Spottiswoode, 1852. iii, 368 p., 66 illus., 28 maps incl. 6 fold. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852, v. 50, no. 1436)

Contains extensive and detailed reports by sledgers from Austin's expedition of 1850-51 wintering at Griffiths Island (the Resolute, the Assistance, Capt. Ommanney, with steam tenders Pioneer, Lt. Osborn, and Intrepid, Lt. Cator) covering journeys along the coasts of northern Prince of Wales, southern Cornwallis, Bathurst, Byam Martin and Melville Islands; also sledgers' reports from Penny's expedition (the Lady Franklin, and Sophia) wintering in Assistance Bay, Cornwallis Island, covering journeys into Wellington and Queens Channels, over most of the Cornwallis Island coast, and parts of western and southern Devon Island; together with translations of natives' reports of the Franklin expedi-These papers are concerned exclusively with the Eastern Arctic.

1. Capt. H. T. Austin's expedition: sledging program, names of crew, ration scale, lists of sledge equipment and clothing (p. 10-13, 251); general instructions and orders (p. 284-93). Reports of sledging parties (usually comprising the leader's instructions, summary report, journal, a track chart, sometimes pencil sketches of features observed): Lt. R. D. Aldrich, his journey to Cape Martyr on Cornwallis Island and Somerville Island, to western Bathurst Island (p. 3-4, 112-31), including meteorological data and observations on sledge navigation, game, sastrugi (p. 116, 124), provisions, equip-R. C. Allen's journey to ment, etc. Somerville, Garrett and Lowther Islands (p. 241-50), with observations for position, magnetic variation, game, pressure ice conditions, celestial phenomena, equipment, with map and description, of Lowther Island (p. 249) and Garrett Island (p. 250). Dr. A. R. Bradford's journey to east Melville Island (p. 202-226) with observations on game, ice conditions, magnetic variation, description of coasts of Bathurst, Byam Martin and Melville Islands. Lt. W. H. Browne's journey along the Peel Sound coast of Prince of Wales Island (p. 28-30, 64-75), his journal including meteorological data, and observations on game, celestial phenomena, geology, description of coasts, and geological description of Cape Walker on Russell Island. Lt. J. B. Cator's account of HMS. Intrepid (steam tender attached to Austin's expedition) in pressure ice Aug. 27-28, 1851 in Baffin Bay (p. 297-98). J. P. Cheyne, his journey to Cape Capel on Bathurst Island (p. 235-40), with observations of Eskimo ruins, game, clothing and equipment. Dr. Charles Ede's journal of his journey to Cape Walker and west to Baring Channel, with his observations on game, celestial phenomena, brief penetration of Peel Sound, geology, Eskimo ruins, meteorological data, a geological sketch of Cape Walker, medical observations, etc. (p. 76–82). R. V. Hamilton's journey to Cape Walker and west to Baring Channel (p. 104–112), with observations on celestial phenomena, game, ice conditions, geology, examination of Young and Lowther Islands (p. 109), equipment.

F. J. Krabbé's journey to Cape Walker (p. 83-87), with meteorological data, and observations on game, celestial phenomena, equipment, ice conditions, etc.; also (p. 270-76) a second journey to Cape Walker. Lt. F. L. M'Clintock's journey of Oct. 2-9 along the southwest Cornwallis coast to Intrepid Inlet (p. 5-8); his spring (Apr.-July) journey west along Cornwallis, Bathurst, and Byam Martin to Melville Island and around Dundas Peninsula: his instructions, report and journal of the trips are given (p. 136-92), the journal includes discovery of Parry's records, observations on game, meteorology, position fixes, magnetic variation, geology, sastrugi, celestial phenomena, flora, coal outcrops; also descriptions of the Byam Martin and Melville coasts, ice conditions, Eskimo ruins, sledging diet, equipment, etc., with sketches of topographic features (Dealy Island p. 158, Winter Harbour p. 174, etc.) and (at 143) a track chart. George F. M'Dougall's April journey to Somerville, Browne, and southwestern Cornwallis Islands, is reported (p. 13-20) with observations on Eskimo ruins, meteorology, etc.; also his May-June trip (p. 276to examine McDougall Sound, between Cornwallis and south Bathurst, with observations on game, position fixes, Eskimo ruins, and vegetation, including visits to Neal and Truro Islands; Walter May's April journey to Byam Martin Island (p. 226-35), with sketches of Intrepid Inlet, Cape Cockburn, and Allison Inlet, together with meteorological data, remarks on provisions, equipment and clothing; also his June-July journey around Griffith Island, with description of coasts, Eskimo ruins, flora, sketches, maps, together with Midshipman Clements Markham's journal of this trip (p. 264-70). Lt. G. F. Mecham's April-May journey to Cape Walker and Baring Channel (p. 29, 53-63), with observations

on game, celestial phenomena, Eskimo ruins, geology, sketch of Cape Walker. track chart; also his second journey to Cape Walker, 74°05' N. 97°36' W., and Baring Channel in late May-June (p. 251-64), with observations on ice conditions, position fixes, magnetic variation, game, examination of Baring Channel, Lowther Island (p. 258), provisions, equipment, meteorological data, etc., sketches. Capt. E. Ommanney's journey to Cape Walker and west along the north and west coasts of Prince of Wales Island (p. 22-52), his journal (p. 30-52) including meteorological data, description of coasts, observations on game, Eskimo ruins, celestial phenomena, geology; Ommanney's report of the Assistance (1851) voyage east from Griffith Island to Greenland, describing landings made at Cape Warrender (southeast Devon Island) and on the Carey Islands, is given (p. 293-94). Lt. Sherard Osborn's journey to Allen Bay and Cape Martyr on southwest Cornwallis is reported (p. 9, 87-89, 295) and journal of his April-June journey to Cape Walker and western Prince of Wales Island is given (p. 89-103) with meteorological data and observations on game, celestial phenomena, geology, position fixes, magnetic variation, ice conditions, equipment, etc. R. B. Pearse's April journey to Cape Cockburn on Bathurst Island (p. 131-36) with observations on game, meteorology, equipment, provisions, description of coasts, etc.; and W. B. Shellabear's journal of a journey also from Griffith Island to Cape Cockburn (p. 193-202), contains observations on meteorology, game, Eskimo ruins (on Cornwallis), equipment, etc.

2. Capt. Wm. Penny's expedition: Admiralty's rejection of his services (p. 300). Dr. R. A. Goodsir's report (1851) covering the journey along the east coast of Cornwallis Island (p. 341-46) to Depot Point, with observations on geology, etc.; report of the journey of Goodsir and Marshall along the east and north coasts of Cornwallis Island (p. 346-59) with observations on game, ice conditions, geology, description of coasts, Capt. Alex Stewart's journal, Apr .-June 1851, covering sledge trips into Wellington Channel (p. 303-316) to Cape Becher on the west coast of Devon Island, including observations on ice conditions, equipment, game, Eskimo ruins, and descriptions of coasts, etc. Dr. John Stuart's report of journey (1851) across Wellington Channel and east along the south coast of Devon to Radstock Bay (p. 360-65), with observations on game, tides, Eskimo ruins, Franklin relics at Beechev Island and Caswall Tower, ice conditions, etc.; also his report (p. 366-67) of a journey along east coast of Cornwallis Island. Dr. P. C. Sutherland presents a detailed report (p. 317-40) of Capt. Stewart's journey to Cape Becher, with observations on meteorology, geology, flora, fauna, celestial phenomena, position fixes, ice conditions and thickness in Wellington Channel, Eskimo ruins, whalebones found inland, migrations of birds, descriptions of the coasts of Devon Island, etc.

Maps (28, mostly sledge track charts) show southwest Cornwallis Island, M'Clintock's sledge journey Oct. 1850 (p. 8); and Allen Bay as sketched by Osborn (p. 9); M'Dougall's journey in Apr. 1851, along southwest Cornwallis (at p. 20).

Russell and Prince of Wales Islands coasts, southwest of Cape Walker, discovered by Ommanney (fold. map at p.

G. F. Mecham's journey Apr.-May 1851 to Russell Island and Baring

Channel (at p. 63).

Prince of Wales Island: part of the coast south from Cape Walker as explored by Lt. Browne, 1851, penetrating Peel Sound (at p. 74).

Dr. Charles Ede's trip to the north coast of Russell Island, with geological

sketch of Cape Walker (p. 81). Griffith Island to Cape Walker, trip by

F. J. Krabbé (at p. 87).

R. V. Hamilton's journey along the north coast of Russell Island (at p. 112). Bathurst Island south and west coasts,

R. D. Aldrich's journey touching on Byam Martin Island (at p. 117).

R. B. Pearse's journey to Cape Cockburn on southwest Bathurst Island (at

p. 136).

South coast of Bathurst Island, around Byam Martin Island, and along east and south coasts of Melville Island as far west as Dundas Peninsula and Liddon Gulf: trips of Lt. M'Clintock and Dr. A. R. Bradford (fold. map at p. 143).

Melville Island south coast: survey of Bridport Inlet and Dealy Island by M'Clintock (p. 158); Skeyne Bay, showing track into Beverly Inlet, by M'Clin-

tock (p. 177).

Shellabear's trip, Griffith Island to

Cape Cockburn (p. 200).

South Cornwallis, Bathurst, Byam Martin and east Melville Islands: track of Dr. Bradford (fold. map at p. 203). Intrepid Inlet, southwest Cornwallis Island, by W. W. May (p. 228).

May's trip, Griffith Island to Cape Gillman on Byam Martin (at p. 235).

Cheyne's trip to Cape Capel, southeast

Bathurst Island (p. 240).

West side of Lowther Island, Garrett Island, by R. C. Allen (p. 249, 250); and his track chart to Lowther, Garrett and Somerville Islands (fold. map at p. 250).

Russell Island, Baring Channel, Lowther Island, examined by G. F. Mecham

(fold. map at p. 263).

Griffith Island sketch maps, showing track of W. W. May, position of Eskimo ruins, rookeries, etc. (p. 266-68).

Griffith Island to Cape Walker, F. J. Krabbé's trip in May 1851 (at p. 276). McDougall Sound, by G. F. M'Dougall

(at p. 282).

#### GREAT BRITAIN. 45229.

Arctic expedition: further correspondence and proceedings connected with the arctic expedition. Presented to both Houses of Parliament by command of Her Majesty. London, Eyre and Spottis-woode, 1852. 216 p. 9 illus., 4 maps incl. 1 fold. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852, v. 50, no. 1449)

Major document. Contains reports, covering 1850-1852, of expeditions in Bering Strait under Collinson's command (Wellesley, Pullen, Moore, and Hooper); reports of expeditions in the Eastern Canadian Arctic by De Haven, John Ross, Austin, and Penny; and reports by Rae of his expedition to southwestern Victoria Island. Numerous letters are included, speculations on the activities of the Franklin Expedition, various proposals for further search, etc.

1. Bering Strait expeditions: Reports of Capt. Richard Collinson (the Enterprise) for 1850-51 are given: p. 11-14, 23-93, 147-87, 201-215; correspondence with the Hudson's Bay Company about his expedition is included (p. 11-14). Report of Cmdr. W. J. S. Pullen (the Plover) on a boat expedition from Wainwright Inlet eastward along the north coast of Alaska to the mouth of the Mackenzie River in 1849 (p. 23-33) is followed by his report on a further boat expedition, July-Oct. 1850, eastward along the north continental coast from the Mackenzie River to Cape Bathurst (p. 33-56), wintering at Fort Simpson, and overland trip to York Factory to sail for England (p. 56-65). Provisions aboard the Plover and Enterprise are listed (p. 68, 72). Detailed report is given of the murder of Lt. John Barnard by natives at Darabin, Alaska (p. 74-78). Instructions to Capt. G. G. Wellesley of the Daedalus to refit the Plover, and Wellesley's report, Oct. 1851, of his voyage and resupply operations at Port Clarence are given, with list of stores on the Plover, and a medical survey of the crew of the Daedalus, also report on a mutiny aboard the schooner Eliza at Port Clarence, and a list of whaling ships lost in Bering Strait, summer 1851 (p. 79-89, 147). Cmdr. Moore reports on activities of the Plover, July-Sept. 1851 (p. 89-91). Journal follows (p. 91-93) of a sledge trip in May 1850 by John Simpson, surgeon on the Plover, examining the inner Hotham Inlet region, Kotzebue Sound, with description of Lake Selawik, and map facing p. 92. Journal of Wm. H. Hooper, mate of the Plover, in charge of part of Cmdr. Pullen's party, describes (p. 148-86) his journey from Fort McPherson to Great Bear Lake, and south to Fort Simpson, Sept. 1849-June 1850. He notes weather and travel conditions, auroras, terrain, natives encountered, etc.; also lists (p. 179-86) about 150 Eskimo (Barrow to Cape Bathurst) words stressing similarity to the coastal, and difference from the inland Chukchi dialect. Capt. T. E. L. Moore reports on the Plover, Oct. 1850-Apr. 1851: wintering at Port Clarence, poor food supplies, scurvy, its disappearance when game was obtained, etc. (p. 201-204). Report of Lt. John Barnard Dec. 1850, of his visit to St. Michael is included, together with correspondence of 1851 concerning his death (p. 204-215). Cmdr. Moore's orders of July 1851 to proceed north, are given (p. 215).

Dr. John Rae reports (p. 15-23) on his sledge trip, Apr.-June 1851, from Fort Confidence down the Coppermine River and along the southwest coast (map at

p. 15) of Victoria Island.

2. Eastern Canadian Arctic Expeditions: Reports, Aug. 1850-Sept. 1851, of the U. S. expedition under Lt. E. J. De Haven, with the Advance and Rescue to Barrow Strait and Wellington Chan-

nel, are given (p. 3-4, 188-200). Capt. Sir John Ross reports concerning the expeditions of Austin, Penny and Ross (p. 4-6) in Barrow Strait and Wellington Channel, and his own voyage, Aug.-Sept. 1851 (on the Felix, Cmdr. Phillips) to Baffin Bay and England (p. 7-10). Reports of Capt. Wm. Penny and six of his officers (the Sophia, and Lady Franklin) to the Arctic Committee, Oct. 1851, on the wintering of the Franklin Expedition at Beechey Island are given (p. 111-24). They include detailed observations on Franklin's winter quarters (p. 112-14), description of the coast of Wellington Channel (p. 114-15), fragmentary wood found (p. 115, 121-25), cairns discovered (p. 115-16), ice conditions in Wellington and Queens Channels (p. 116), tides and currents (p. 117), animals (p. 117-18), climate (p. 118-19, 121), position fixes (p. 119), and list of articles found at Beechey Island (p. 120). Improvements to the provisions, clothing and equipment supplied to arctic traveling parties are recommended by Capt. H. T. Austin, Dec. 1851 (p. 106-110) and by Cmdr. W. J. S. Pullen (p. 110-11); itemized lists for an eight-man party are included. Geological and natural history specimens collected by the Resolute in 1850-1851 are listed (p. 126-28), and geological description is given (by Richard King) of Whalefish, Duck and Carey Islands, Bylot Island (Possession Bay), south coast of Devon Island (including Beechey Island and Cape Warren), Cornwallis Island (Barrow Inlet), and Griffith Island, together with natural history Report of the entry of whaler Prince of Wales into Jones Sound in 1848 is added (p. 128).

r

3. Speculations are made, 1849-1851, on the activities of the Franklin Expedition, by Capt. J. C. Ross, J. Romme, and John Shillinglaw (p. 130-32). Proposals for further search expedition were submitted in 1851-1852 by Lt. B. C. T. Pim, Lt. Wm. H. Hooper, Capt. Wm. Penny, Lt. S. Osborn, Cmdr. R. Maguire (p. 94-106); Major J. Bentham (p. 129), John Christopher, Lt. Col. C. H. Smith, Lt. John Gilmore (p. 132-35); by Dr. Robt. M'Cormick, Cmdr. Pullen, Capt. John Ross (p. 137-42), and Donald Beatson (p. 215-16); Augustus Petermann's plan of search is given (p. 142-46, and fold. map); he advocates the so-called open sea route between Novaya Zemlya and Spitsbergen to the Chukchi Sea. Correspondence with Russian government regarding the Franklin Expedition is given (p. 125–26); and translations of statements made by the interpreter Adam Beck regarding the reported murder of Franklin expedition personnel by natives in northwest Greenland (p. 135–37).

Maps (four) comprise: a rough tracing of the coast examined by Dr. John Rae during May 1851: southwestern Victoria Island, from Richardson Island, west and north to Prince Albert Sound (at p. 15); a small thumbnail sketch map of the area west of Mackenzie River (p. 47); chart of John Simpson's journey in May 1850, to the eastern end of Hotham Inlet, Kotzebue Sound (at p. 92); polar chart (at p. 142) illustrating Petermann's paper, with Franklin's position indicated as in the Chukchi Sea, and a relief route between Spitsbergen and Novaya Zemlya across the Arctic Basin shown.

Copy seen: DLC.

## 45230. GREAT BRITAIN.

Copy of an account of the Naval receipt and expenditure, for the year ended the 31st March 1851. Ordered by the House of Commons to be printed, 3 February 1852. 6 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852, v. 30, no. 14)

Contains Supplementary estimate 1850-51 covering cost of the Franklin search expeditions under Capt. H. T. Austin, and Capt. Wm. Penny.

Copy seen: DLC.

## 45231. GREAT BRITAIN.

Preserved meats, Navy. Returns [to an order of the Honourable the House of Commons, dated 5 February 1852] showing the date and terms of all contracts for preserved meats for the use of Her Majesty's Navy; also the quantities issued . . . specifying the quantities fit for use, as well as the quantities either condemned or returned into store as unfit for use, from any of Her Majesty's stores or ships, whether at home or abroad . . . Ordered by the House of Commons to be printed, 13 February 1852. 6 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852, v. 30, no. 59) also pub. as: House of Lords, Accounts and papers, 1852, v. 17, no. 29.

Contains tabulated data concerning contracts for salt beef and pork, giving date, quantity, price/lb., packaging, rejection penalty, security required, period of warranty, ships supplied, etc. Data are included for seven arctic expeditions 1839-1850, including Franklin's last. Some supplies to the Assistance and Resolute (Capt. Austin) were condemned. Copy seen: DLC.

#### 45232. GREAT BRITAIN.

Arctic expeditions. Return to an address of the Honourable the House of Commons dated 20 February 1852, for: Papers in connection with the late arctic expeditions, or with any which may be in preparation. In continuation of the papers presented to the House on the 7th March 1851, and on the 3rd February 1852.Ordered by the House of Commons to be printed, 27 February 1852. (Great Britain. 18 p. Parliament. House of Commons. Sessional papers. Accounts and papers, 1852, v. 50, no. 115)

Contains letter by Capt. Wm. Penny, Jan. 1852, protesting the Admiralty's refusal to use his services in the renewed search for Franklin (p. 1–12); also letters, etc., about current rumors of the Franklin Expedition being at Byron Bay in the Hawaiian Islands, and translation of Adam Beck's deposition, cf. No. 45235.

Copy seen: DLC.

#### 45233. GREAT BRITAIN.

Arctic expedition. Return to an order of the Honourable the House of Commons dated 6 April 1852, for: Copy of the report of Dr. Rae, of the proceedings of the arctic searching expedition under his command, since the 10th day of June last, with a sketch of his route. Admiralty, 6 April 1852, J. H. Hay, Chief Clerk. Ordered by the House of Commons to be printed, 6 April 1852. 12 p. fold. map. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852, v. 50, no. 248)

Contains report of the boat expedition, June-Sept. 1851, from Fort Confidence to the mouth of the Coppermine River, eastward along south coast of Coronation Gulf past Capes Barrow, Flinders, and Alexander to Finlayson Islands (p. 3); eastward around Cambridge Bay and past Cape Colborne and Parker Bay to southeast Victoria Island (p. 4); thence north past Taylor Island and Cape Adelaide (p. 5) to Cape Alfred, John Halkett Island, almost to Pelly Point (70°11' N. 100°51′ W.) on Aug. 13 (p. 6.). Retracing his track southward, Rae penetrated deeply into Albert Edward Bay, returned to Cape Adelaide, and traveled the coast south and west into Parker Bay, where a wooden relic, possibly from Franklin's expedition, was found. He continued west along south coast of Victoria Island across Cambridge Bay (p. 9) to Ross Point, across Coronation Gulf to Cape Krusenstern, Cape Kendall and up the Coppermine River to Fort Confidence on Sept. 10. Rae's report contains numerous astronomic fixes, observations on flora, fauna, geology, ice conditions, etc. Map of the coast examined by Rae in spring-summer 1851, shows the tracks of this boat expedition, and the sledge trip made earlier in the same year northwestwards to Prince Albert Sound on west Victoria Island.

Copy seen: DLC.

#### 45234. GREAT BRITAIN.

Arctic expedition. Return to an order of the Honourable the House of Commons dated 4 May 1852, for: A return of the sailing orders given to Sir Edward Beleher relating to the arctic expedition. Admiralty, 6 May 1852. J. H. Hay, Chief Clerk. Ordered by the House of Commons to be printed, 7 May 1852. 4 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852, v. 50, no. 317) See also No. 45238.

Contains Admiralty orders (1852) for Beleher to proceed with the Assistance, Resolute, Pioneer, Intrepid, and North Star to Lancaster Sound, establishing the North Star as depot ship at Beechey Island, and there dividing the expedition into eastern and western divisions to proceed, respectively, up Wellington Channel and west to Melville Island.

Copy seen: DLC.

#### 45235. GREAT BRITAIN.

Aretic expedition. Return to an order of the Honourable the House of Commons dated 6 April 1852, for: A copy of any further correspondence which has been transmitted to the Admiralty between Admiral Sir John Ross and the Danish Inspector-General, touching the fate of the expedition under Sir John Franklin. Admiralty, 18 May 1852. J. H. Hay, Chief Clerk. Ordered by the House of Commons to be printed, 21 May 1852. 12 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852, v. 50, no. 390)

Contains statements and depositions made by Adam Beck, according to reports of Greenlanders regarding the reported murder of Franklin expedition personnel, with numerous speculations concerning the fate of Franklin.

45236. GREAT BRITAIN.

Vessels in the North Atlantic. Return to an address of the Honourable the House of Commons dated 4 June 1852, for: Copies of communications between the Admiralty and any public authorities at home or abroad, in reference to certain vessels observed on an iceberg in the North Atlantic in 1851, and supposed to have been abandoned. Ordered by the House of Commons to be printed, 22 June 1852.

40 p. illus. plate, fold. map. (Great Britain. House of Commons. Sessional papers, Accounts and papers, 1852, v. 50,

no. 501).

Contains correspondence regarding report of the Renovation having sighted two ships on an iceberg drifting over the banks of Newfoundland in 1851. They were considered possibly to have been the Erebus and Terror of the lost Franklin Expedition, but more probably were abandoned whalers. Extracts from the Renovation's log (p. 27–28), sketches of the two vessels on iceberg are included, also fold. map showing the latter's position (due east of St. Johns) Apr. 18–22, 1851, with further information concerning the incident, signed by Ommanney.

Copy seen: DLC.

#### 45237. GREAT BRITAIN

Select committees, return to an order . . . . 3 August 1855. 12 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1854-5, v. 44, no. 489). Includes (p. 1) data on the Arctic Committee. cf. No. 45248

Copy seen: DLC.

## 45238. GREAT BRITAIN.

Arctic expeditions. Return to an address of the Honourable the House of Commons dated 19 November 1852, for: Copies of any correspondence received at the Admiralty from Sir Edward Belcher's squadron . . . and from any other of the arctic expeditions since the dates of the last returns . . . from Mr. Kennedy of the Prince Albert discovery ship; from Commander Inglefield of the screw vessel Isabel, reporting his discoveries and proceedings in the polar sea; of any plans or suggestions of search for Rear-Admiral Sir John Franklin, and the ships and crews of his expedition; and, of any further

correspondence on the subject of the arctic regions, since the last laid before this House in . . . session 1852. Admiralty, 16 December 1852, J. H. Hay, Chief Clerk. Ordered by the House of Commons to be printed, 20 December 1852. iv, 88 p., 3 fold. maps. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852–53. v. 60, no. 82)

Contains reports of arrival of Belcher's expedition at Beechey Island; Kennedy's reports of the voyage (Prince Albert) into Prince Regent Inlet; Inglefield's reports on voyage of the Isabel into Smith, Jones and Lancaster Sounds. In the Western Arctic, around Bering Strait, the activities of Moore, Frederick and Maguire are described. Finally, a number of additional search proposals are outlined.

1. Sir Edward Belcher's expedition with the Assistance, Resolute (Capt. Kellett), North Star, Pioneer and Intrepid: orders (1852) from the Admiralty, instructions on burial of records at cairns, ships' complements; reports en route to Greenland, on voyage north along the west coast, to Cape Warrender, and to Beechey Island (p. 1-13); visit of the Pioneer to Cape Castlereagh and Wollaston Islands, search of Beechev Island for Franklin expedition traces by Cheyne and Hamilton (p. 13-14, 19); Capt. Kellett's trip to Beechey Island, Franklin relics found at Caswall Tower, a bluff at the head of Radstock Bay, southwest Devon Island (p. 18-19). Cmdr. W. J. S. Pullen's reports on the North Star (p. 19-24) including his orders of 1852 from Belcher (p. 16), and from Kellett (p. 21), and the boat voyage to Maxwell Bay.

Capt. Wm. Kennedy reports (p. 25-32) on Lady Franklin's private expedition of the Prince Albert with Lt. Bellot aboard: voyage to Beechey Island and south into Prince Regent Inlet to winter quarters at Batty Bay on Somerset Island, activities Aug. 1851-Oct. 1852, including visit to Pond Inlet, being marooned two months at Port Leopold; winter at Batty Bay, and sledging south into Brentford Bay, where Bellot Strait was discovered; sledge trip westward across Franklin Strait to Prince of Wales Island, crossing overland to head of Ommanney Bay, returning to the east coast in Browne Bay, thence north to Cape Walker, and return to Batty Bay via the north and east coasts of Somerset Island. Fold. map shows track of Kennedy's sledge journey.

Capt. E. A. Inglefield's private expedition for Lady Franklin in the Isabel 1852 (p. 33-41): preparations, voyage into Baffin Bay along West Greenland coast, exploration of Smith Sound (Ellesmere coast), Jones Sound, entering Lancaster Sound to Beechey Island. Fold. map shows Inglefield's discoveries.

2. In the Western Arctic (Bering Sea region), Capt. T. E. L. Moore reports (p. 42-43, 65) on wintering 1851-52 of the Plover at Port Clarence; boat trip July-Aug. 1852 to Pt. Barrow under Cmdr. R. Maguire, his journal (p. 48-59) with comments on ice, coasts, natives; fold. map. Capt. Charles Frederick reports (p. 60-72) on summer 1852 voyage of the Amphitrite from Honolulu to Port Clarence with supplies for the Plover, cruise northward to Icy Cape; his survey of the Plover, with report of preserved meats, list of provisions, etc.

3. Franklin search proposals (1852) by Dr. John Rae, Cmdr. Henry Trollope, Capt. Wm. Penny, Lt. W. H. Hooper, Augustus Petermann; Capt. E. Ommanney's proposal for attempt on the North Pole by a steam vessel based on Spits-

bergen, etc. (p. 72-88).

Maps (three) show Somerset and north Prince of Wales Islands, Wm. Kennedy's discoveries (at p. 32); north end of Baffin Bay, Smith, Jones and Lancaster Sounds, Inglefield's discoveries 1852 (at p. 40); Bering Strait and northwest coast of Alaska from Norton Sound to Smith Bay, with inset of Moore Harbor, Pt. Barrow (at p. 59). Copy seen: DLC.

#### 45239. GREAT BRITAIN.

Ship Rattlesnake. Return to an order of the Honourable the House of Commons dated 27 April 1853, for: Copies of extracts of any minutes or other documents connected with the selection by the late Board of Admiralty of the ship Rattlesnake in preference to a steamer, for the purpose of endeavoring to communicate with the Plover; And copies of Instructions given . . . to the captain of the Rattlesnake. Admiralty, 3 May 1853. J. H. Hay, Chief Clerk. Ordered by the House of Commons to be printed, 4 May (Great Britain. Parliament. 1853. 4 p. House of Commons. Sessional papers, Accounts and papers, 1852-53, v. 60, no. 444) also pub. in No. 45241 (infra), p. 147-49.

Contains orders of 1853 from the Admiralty to Cmdr. Henry Trollope to proceed to Bering Strait with the Rattle-

snake, to winter at Port Clarence; also Admiralty orders (1853) to Cmdr. Maguire to contact the Rattlesnake in Grantley Harbor, Seward Peninsula, Copy seen: DLC.

#### 45240. GREAT BRITAIN.

Arctic regions. Return to an order of the Honourable the House of Commons dated 1 August 1853, for: Copies of the sailing orders and instructions to Commander Inglefield, of Her Majesty's Ship Phoenix, employed in the arctic regions; Of the instructions to Mr. Kennedy in command of the Isabel . . .; Of any orders and instructions given to Capt. Collinson, of the Enterprise, of a later date than the 15th day of January 1850; And, of any reports received from Captain Collinson of a later date than the 9th day of July 1851. Admiralty, 19 August 1853. John Jones Dyer, Acting Chief Clerk. Ordered by the House of Commons to be printed, 20 August 1853. 4 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1852-53, v. 60, no. 1013) also pub. in No. 45241 (infra), p. 1-2.

Contains Admiralty orders (1853) to Inglefield to proceed with the *Phoenix* and *Breadalbane* to Beechey Island, accompanied to Disko by the transport *Diligence*; Inglefield is to deliver stores, and return directly to England.

Copy seen: DLC.

#### 45241. GREAT BRITAIN.

Papers relative to the recent arctic expeditions in search of Sir John Franklin and the crews of HMS. Erebus and Terror. Presented to both Houses of Parliament by command of Her Majesty. London, Eyre and Spottiswoode, 1854. 225 p., 26 illus., 5 fold. maps. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1854, v. 42, no. 1725.)

Contents are largely comprised of an early report of Belcher's expedition, covering activities during the 1852-53 winter and spring of the eastern division (under Belcher himself) out of Northumberland Sound, the western division (under Kellett) at Dealy Island, and those of Pullen and the North Star at Beechev Island, the latter including M'Cormick's boat expedition up Wellington Channel. Inglefield's voyage of 1853 with the Phoenix and Breadalbane is also recorded. In the Western Arctic, from Collinson's expedition through Bering Strait, M'Clure's narrative of 1850-53 predominates, but reports are also included from Frederick, Maguire and Trollope.

#### EASTERN ARCTIC

1. Capt. E. Belcher, with his eastern division, the Assistance and Pioneer reports (p. 13, 62-84) the voyage into Wellington Channel to winter quarters in Northumberland Sound, a boat expedition north across Belcher Channel to Cornwall Island, journeys westward across north Bathurst Island by Lyall and Cheyne; naming of new geographical features; Eskimo ruins; footwear of sledgers with illus. (p. 72); organization of sledge expeditions to the northeast under Belcher, and southwest under Richards (p. 75-77); depots established at Capes Majendie and Lady Franklin, Mount Beaufort, and Northumberland Sound; crews; fold. map (at p. 84) shows Belcher's discoveries through Wellington and Queens Channels to Cornwall Island.

2. Capt. Henry Kellett, with the western division, the Resolute and Intrepid, gives (p. 85-97) a condensed report (1852-53) of the voyage from Beechey Island westward to winter quarters at Dealy Island off the south coast of Melville Island, activities of the 1852 autumn sledge parties, one of which discovered message left by M'Clure at Winter Harbour; sledge journey by Pim to contact M'Clure at the Investigator's winter quarters in Mercy Bay, Banks Island (p. 87, 89-93); arrival at Dealy Island of the Investigator crew, in poor health; monthly temperature tabulation and wind directions (p. 95-97) at Dealy Island, 1852-53.

3. Cmdr. W. J. S. Pullen, at Beechey Island, North Star (p. 103-147): journal Aug. 1852-Feb. 1853 (p. 103-129), including visits by the Prince Albert and the Isabel (p. 105-108, 110-12); ice dock cut for North Star (p. 107); Pullen's expedition to Maxwell Bay, Devon Island; Eskimo ruins (p. 109); reference to reported entry of the Prince of Wales into Jones Sound (p. 111); M'Cormick's boat expedition (p. 113, 127); the North Star aground, and means adopted for her release (p. 115-23); wintering arrangements aboard ship, ice in Wellington Channel, birds and animals, mean, maximum and minimum temperatures at Beechey Island 1852, wind observations Jan. 1853, tidal currents (p. 124, 126, 129); dogs (p. 125, 128); clothing, victuals (p. 125-26). Reports of proceedings, North Star, 1852-53 (p. 131-36), with outline chart, showing position of the North Star in Erebus Bay, maps at end of the volume; journal of a sledge journey by Shellabear from Beechey Island across Wellington Channel to Cape Phillips on Cornwallis Island (p. 137-42). Drowning of Joseph René Bellot is reported (p. 142-47), cf. No. 1304, 27482

4. Dr. Robert M'Cormick's boat expedition up Wellington Channel in 1852, from Beechey Island to Baring Bay (Owen Point) and return, is reported (p. 187-225), with numerous detailed observations on ice conditions, coastal features, flora, fauna, Eskimo ruins, geology, etc.; M'Cormick's report is illustrated with sketches of topographic features in southwestern Devon Island, viz. (in turn, except as pages cited): Cape Spencer, Lovell Point, Cape Bowden, Cape Mc-Bain, Cape Daniell (i. e. Bellot Point?), Emery Bay, Pim Point, McCormick Bay, Franklin Beacon (p. 196, 208), Cape Osborn (p. 197, 205), Mount Providence, Baring Bay (p. 199, 205, 217), Owen Point (p. 202, 203), Prince Alfred Bay, Eden Point, Rogier Head, Cape Thoms, Domville Point, Griffin Bay, and Caswall Tower, also Cornwallis Island, east coast. M'Cormick concluded his report with (p. 216-25) a list of game killed, dimensions of a polar bear; speculations on the Franklin expedition; views on preservation of health in the Arctic (p. 223-24), including recommendations regarding diet, provisions, clothing, exercise, medicines; and proposal for further search. M'Cormick's track chart is appended, map 3 at end of volume.

5. Capt. E. A. Inglefield: reports, etc. from his voyage with the Phoenix and Breadalbane June—Sept. 1853, to take supplies and coal to Belcher's base at Beechey Island and return at once to England (p. 1-20). Includes crushing of the whaler Rose, engineer's report on Greenland coal (p. 10), sinking of the Breadalbane, report of the drowning of

Bellot.

#### WESTERN ARCTIC

6. Capt. Robt. M'Clure in the Investigator: report (1850-53) of Investigator's passage (1850) eastward along the north continental coast to Point Warren (p. 24-29), and to Cape Bathurst (p. 29-33), with detailed description of Eskimos, Horton River and Smoking Mountains (p. 33-34), landing on Banks Island and penetration of Prince of Wales Strait to

winter quarters at Princess Royal Islands (p. 34-37); sledge journeys (1851) northeastward to Viscount Melville Sound (p. 37-39), along west coast of Victoria Island into Prince Albert Sound, with detailed description of Eskimos, discovery of copper ore (p. 39-40); sledge journey around northwestern Victoria Island into Hadley Bay, and along southeastern Banks Island (p. 40-41), failure of attempt to enter Viscount Melville Sound, return around south end of Banks Island, continuing northward up west coast (p. 43-46), entrance into M'Clure Strait to winter quarters at Mercy Bay (p. 49); spring (1852) sledge journey to Winter Harbour on southwest Melville Island (p. 50); second winter (1852-53) at Mercy Bay (p. 51-54); tabulated meteorological data 1850-53, game killed, daily rations, boats stores, etc.; arrival of Pim from one of Kellett's sledge parties at Winter Harbour, and movement of the Investigator's crew to Kellett's winter quarters at Dealy Island (p. 87, 89-93). M'Clure's despatches announcing discovery of Northwest Passage are delivered in England by Cresswell (p. 21-22). Map 4 at end of volume shows Northwest Passage as discovered by M'Clure.

7. Capt. C. Frederick in the Amphitrite: reports (p. 156-59) his 1853 voyage from Honolulu to Bering Strait and the northwest coast of Alaska, his survey of the

Plover.

8. Capt. R. Maguire in the Plover: report of the voyage (1852) from Port Clarence to winter quarters at Point Barrow, boat expedition eastward to Dease Inlet, sledge journey to the Colville River mouth, and return to Port Clarence (p. 160-63). Appended (p. 165-85) is Maguire's narrative covering the same period, with detailed observations on natives, their appearance, customs, manners, habits, thievery, villages, etc.; specific altercations with them, and means of handling such are described; orders (1853) from Admiralty (p. 149); report by Vernon of brief boat voyage southwest of Point Barrow (p. 185-86); map showing tracks followed by the Plover's traveling parties faces p. 186; survey of the Plover (p. 159).

9. Cmdr. H. Trollope in the Rattlesnake: orders and report Mar.—Sept. 1853 (p. 147-56) of voyage to Bering Strait to resupply the Plover, and return

to England.

Maps (5 fold.): Part of the discoveries of Capt. Belcher, 1852-53: west coast of

Devon Island, and isthmian connection between Cornwallis and Bathurst Islands

(at p. 84).

Journeys of Cmdr. Maguire: North Alaska coast with track of boat and sledge trip, Mar.-Apr. 1853, also positions of the *Investigator* and *Enterprise* by natives' reports (at p. 186).

Track chart of the east coast of Wellington Channel and the shores of Baring Bay, from Beechey Island to Owen Point, explored by R. M'Cormick, 1852

(at end of volume).

Northwest Passage discovered by M'Clure, also the coast explored by J. C. Ross in 1848–49; Richardson, 1848–49; M'Clure, 1850; Austin, 1850; Penny, 1850; Rae, 1851; Kennedy and Bellot, 1852–53; Inglefield, 1852, 1853; and Belcher, 1852–53 (at end of volume).

Position of the North Star in Érebus and Terror Bay, 1852–53: a large-scale map of the Beechey Island region showing locations of cairns and other landmarks, with positions of fast ice in the Bay on Aug. 9, 26, 1852, and Aug. 23, 1853 (at end of volume).

Copy seen: DLC.

#### 45242. GREAT BRITAIN.

Arctic expeditions. Return to an address of the Honourable the House of Commons dated 17 March 1854, for: Copy of letter addressed by Lady Franklin to the Lords Commissioners of the Admiralty, dated the 24th day of February 1854, in reference to their Lordships' announcement in the London Gazette of the 20th day of January 1854, respecting the officers and crews of Her Majesty's Ships Erebus and Terror; and of a copy of such notice. Ordered by the House of Commons to be printed, 24 March 1854. 14 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1854, v. 42, no. 129.)

Contains Lady Franklin's protest against the Admiralty's removal from the Navy List in 1854, of the names of members of the Franklin expedition as having died in Her Majesty's service.

Copy seen: DLC.

## 45243. GREAT BRITAIN.

Arctic expedition. Return to an order of the Honourable the House of Commons dated 4 April 1854, for: Copies of any instructions . . . to the commanders of Her Majesty's ships now engaged in the arctic regions in the search for Sir John Franklin's expedition. Admiralty, 7

April 1854. John Jones Dyer, Chief Clerk. Ordered by the House of Commons to be printed, 7 April 1854. 4 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1854, v. 42, no. 171).

Contains orders of 1854: to Cmdr Henry Trollope, to proceed in the Rattle-snake from Honolulu to winter at Grantley Harbor, Alaska; and to Cmdr. R. Maguire, to return the Plover to Valparaiso, when the crew of the Enterprise

is known to be safe.

Copy seen: DLC.

## 45244. GREAT BRITAIN.

Arctic expedition. Instructions from the Lords Commissioners of the Admiralty for the arctic expedition. Presented to Parliament by Her Majesty's command. Ordered by the House of Commons to be printed, 28 April 1854. 4 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1854, v. 42, no. 200)

Orders of Apr. 1854: for Capt. E. A. Inglefield to proceed with supplies aboard the Phoenix and Talbot to Beechey Island; and for Capt. E. Belcher, apprising him of the Admiralty's decision to withdraw from Franklin Search activities, and recalling the Assistance, Pioneer, Resolute, Intrepid, Enterprise, Investigator, North Star, Phoenix and Talbot.

Copy seen: DLC.

#### 45245. GREAT BRITAIN.

Further papers relative to the recent arctic expeditions in search of Sir John Franklin and the crews of H. M. S. Erebus and Terror. Presented to both Houses of Parliament by command of Her Majesty. January 1855. London, Eyre and Spottiswoode, 1855. iv, 958 p., 74 illus., 37 maps incl. fold. (Great Britain. House of Commons. Sessional papers, Accounts and papers, 1854–55, v. 35, no. 1898)

Most of this bulky volume is formed of reports arising directly out of Belcher's expedition, both its eastern (Belcher's) and western (Kellett's) divisions, 1852–1854. With his depot ship stationed at Beechey Island, off southwestern Devon Island, Belcher took the Assistance and Pioneer north into Wellington Channel to winter 1852–53 in Northumberland Sound. Meanwhile, the Resolute and Intrepid under Kellett sailed west to winter (1852–53) at Dealy Island, Bridport Inlet, south Melville Island. For the winter of 1853–54 Belcher's vessels

moved south to Baring Bay; Kellett's vessels were frozen in near Cape Cockburn, southwest Bathurst Island. these vessels were abandoned in 1854. The depot ship, North Star, under Cmdr. W. J. S. Pullen, remained at Beechey Island throughout. Thus the Belcher expedition papers comprise three groups, viz. those of Belcher, of Kellett and of Pullen. Two other expeditions are also referred to, which pertain to the Eastern Canadian Arctic viz., those of Inglefield (1854) and Rae (1853-54). In addition, relatively minor contributions to this volume are made by the expeditions and ships of Collinson (1851-54) in the Enterprise, Houston (1854) in the Trincomalee, M'Clure (1853-54) in the Investigator, Maguire (1853-54) in the Plover, and Trollope (1854) in the Rattlesnake, all of which operated almost exclusively in the Bering Sea and Western Arctic regions.

#### EASTERN ARCTIC (Eastern Division)

1. Belcher's expedition, Eastern Division: Capt. E. Belcher's report outlining his sledge journey in 1853 from Northumberland Sound along the north coast of Grinnell Peninsula (northwest Devon Island) into the west end of Jones Sound sighting North Kent Island; examination of Arthur Fiord, and journey to Buckingham and Graham Islands in Norwegian Bay (p. 13-16); sledge crews from Assistance and Pioneer (p. 313); good harbor at Port Refuge and passage of Belcher's ships southward into Baring Bay, Wellington Channel (p. 17-20); discovery of traces of Bellot's equipment on ice floe (p. 18-19); report of winter 1853-54 at Baring Bay; orders (1854) from Admiralty (p. 1-3); schedule of traveling operations in spring of 1854 from the Assistance and Pioneer (p. 43); depots laid are tabulated (p. 44), and listed seriatim for Fife Harbour, Cape Cockburn, Assistance Harbour, Cape Hotham, Cape Bunny, Barlow Inlet, Cape Rescue, Point Lovell, Cape Lady Franklin, Mount Beaufort, Point Loney and Cape Majendie (p. 101-103); Belcher's report to Admiralty of activities out of Baring Bay, Mar.-Aug. 1854, with resumé of Kellett's sledge expeditions from Dealy Island, and abortive effort to contact Collinson's Enterprise (p. 48-51); medical condition of crews, including the Investigator's, and events leading to abandonment of Belcher's ships (p. 52-54); report on abandonment of the four

vessels of Belcher's squadron (p. 60–66); details of memorial tablet at Beechey Island (p. 63); documents deposited at Cape Hotham (p. 86) and Beechey Island (p. 66–68), including stores and provisions lists; return voyage from Beechey Island of North Star, Phoenix and Talbot to England (p. 64–66). The officers under Belcher's command, as part of his eastern division were: Cmdr. G. H. Richards, Lt. Cmdr. Sherard Osborn, Lts. J. P. Cheyne, Walter W. May, H. W. Pim, Drs. D. Lyall and J. B. Ricards, together with W. B. Shellabear (2nd Master), F. W. Pym (Mate), J. F. Loney (Master), F. B. Herbert (Mate), J. B. Grove (Mate) and J. H. Allard (Master). Their reports are listed in that order.

2. Cmdr. G. H. Richards: report (Aug.-Sept. 1852) of boat expedition from Northumberland Sound north to Exmouth and Table Islands in Belcher Channel, containing topographical descriptions of each (p. 117-22); report (Mar. 1853) of sledge journey from Northumberland Sound across Queens Channel to lay depots at Cape Lady Franklin on northeast Bathurst Island (p. 122-24); orders from Belcher to proceed west towards Melville Island (p. 305-307); report of an 860-mile sledge journey, Apr.-July 1853, from the Assistance in Northumberland Sound westward across north Bathurst Island and Byam Martin Channel, to Melville Island, around Sabine Peninsula into Hecla and Griper Bay, thence south to visit Kellett in the Resolute at Dealy Island, returning to the Assistance by way of eastern Melville and north Bathurst Island, with list of sledge crew, scheme of victualling sledgers, and scale of victualling (p. 180-85), also track chart at p. 188. Richards' journal of same journey is given (p. 314-40) in much greater detail, including numerous meteorologic and astronomic observations, geologic and topographic descriptions, flora, fauna, game killed, etc., with abstracted distances and travel times (p. 340); speculations on the Franklin expedition (p. 340-43); progress reports to Belcher en route from Point Deception, Point Success, and Melville Island (p. 307-309). Richards' orders from Belcher (p. 29-31, 373-75) and report of his sledge journey Feb.-May 1854 from Baring Bay down Wellington Channel to Beechey Island (p. 344), thence westward to the Resolute in Barrow Strait southwest of Cape Cockburn (p. 20–22); Richards' journal of this journey (p. 375–85), his meteorological record en route Feb. 22–May 4 (p. 55), and report of his arrival aboard the

Resolute (p. 385-86, 395-96).

3. Lt. Cmdr. Sherard Osborn: orders from Belcher to accompany Richards (p. 187), orders from Richards to return from Melville Island to Northumberland Sound (p. 210-11, 311-12); Osborn's journal Mar. 1853 of the sledge journey from Northumberland Sound to Cape Lady Franklin (p. 125-28) with sketches of Spit Island, Cape Lady Franklin and Cape Sir John Franklin; sledge crew, equipment and weights (p. 185-86); journal, Apr.-July 1853, of the sledge journey to Melville Island (p. 188-253). including list of sledges in Southwestern Division (p. 188-89); sketches of Cape Sir John Franklin and coastal features of Bathurst Island, Cape Lady Jane Franklin (p. 190, 191); also sketches of Cape Smart (p. 196), Cape Fortune (p. 198), Cape Success (p. 201), Weatherall Bay (p. 206), North West Cape (p. 208, 209); Capes Fortune and Richards (p. 218), north coasts of Bathurst Island (p. 223, 225, 227), Helen Island (p. 228), Saffron Hill, Cape Lady Franklin (p. 235, 236), Hooker Islands (p. 239), islands in Queens Channel (p. 240, 241, 253), Foul Weather Bay (p. 248); track chart across Queens Channel at p. 218 (cf. Richards' map at p. 188); Osborn's journal contains many magnetic and astronomic observations, bearings, meteorological data, etc., besides topographic descriptions and observations on geology, flora, fauna, soils, etc.; list of fossils and geological specimens collected (p. 254); remarks on ice conditions, tides and currents, driftwood (p. 255-58); reports of proceedings (p. 258-61); abstracts of times and distances (p. 262-63 and 186); list of birds and animals killed (p. 186); a series of sketches (p. 449-53) on the 1853 journey from Northumberland Sound westward across north Bathurst and Melville Islands, including Capes Colquhoun, Fortune, and Success, Helen Island and islands in Queens Channel; sketch maps of Lady Franklin Peninsula and Loney Island, and the west coast of Queens Channel (p. 454-57).

4. Lt. J. P. Cheyne: orders from Belcher to visit Cape Becher, and report of sledge journey thither from Northumberland Sound along the Grinnell Peninsula coast, northwest Devon and return, Apr.

21–28, 1853 (p. 139–43) also (p. 147–53) a second return journey to Cape Becher from Northumberland Sound, May 8–23, with a sketch of Cape Becher, abstract of distances traveled (p. 152), astronomic fixes, and map at p. 152; orders (1854) from Belcher to move to Beechey Island (p. 33–34, 433); orders from Richards (p. 393, 397); orders from Kellett (p. 413, 432–33) and report of sledge journey from Beechey Island to the Resolute, off Cape Cockburn, southwest Bathurst Island and return, Apr.–May, 1854 (p. 423–24), and from Beechey Island to

li

i

Baring Bay (p. 433-34).

5. Lt. Walter W. May: orders (1853) from Belcher to accompany Richards (p. 272-81), and from Richards to return from Melville Island to Northumberland Sound (p. 284, 311); report of sledge journey from Beechey Island to Northumberland Sound (p. 162), and from there to Cape Lady Franklin (p. 128-30); report of sledge journey with Richards westwards across north Bathurst to northeast Melville Island (Boat Beach) and return (p. 281-88), including sketches of topographic features along north Bathurst Island, and abstract of times and distances; orders (1854) from Belcher (p. 34, 343 and 417), from Richards (p. 398-400). from Pullen (p. 399) and from Kellett (p. 432); reports of sledge journeys from Beechev Island to Assistance Bay (p. 361. 400), from Baring Bay to Beechey Island (p. 418, 431-32, 443-44); criticism by Belcher (p. 418); series of sketches of coasts of Wellington Channel (1852) on p. 458-68, including Capes Bowden, Osborn, Grinnell. Majendie, Becher. John Barrow Mount, Refuge (McCor-mick) Bay, Dundas Island and north coast Bathurst Island, Lt. H. W. Pim: orders (1854) from Richards, sledge crew. report of sledge journey from Beechey Island to Cape Hotham and Barlow Inlet (p. 445, 447-48).

6. Dr. D. Lyall: oxders (1853) from Belcher and from Richards (p. 170-72, 309-310); report (p. 144-45) and journal (p. 173-79) of the sledge journey from Northumberland Sound westwards to Cape Fortune on northwest Bathurst Island with Richards, list of sledge equipment with weights (p. 172); medical survey of crew of the Assistance, 1854, at Baring Bay (p. 389-91). Dr. J. B. Ricards: journal of journey from Northumberland Sound to Cape Lady Franklin in 1853 (p. 133-34); medical survey of crew of the North Star, 1854, at Beechey

Island (p. 347), and of the Investigator (p. 372). Mr. W. B. Shellabear (Second Master): journal, Sept. 1852, of a boat voyage from Beechey Island north to Cape Bowden (p. 288-90), with track chart (at p. 289) and sketch of Cape Bowden: orders from Pullen, and journal. Sept. 1853, of boat journey from Beechev Island to Cape Bowden (p. 290-93), with list of stores deposited; journal of sledge journey from Beechey Island to Baring Bay (p. 297-300), with stores list deposited at Bellot Point; orders (1854) from Belcher (p. 343); journal of a sledge journey from Beechey Island across Barrow Strait to Capes Rennell and Bunny on Somerset Island (p. 356-60); with sledge crew, and contents of the Cape Bunny depot; report of sledge journey from Beechey Island to the Resolute (p. 424) with list of sledge equipment; lists of provisions deposited at Assistance Bay and Cape Bunny (p. 425); abstracts of times and distances also track chart of Shellabear's journeys (p. 296). F. W. Pym (Acting Mar. 1853, of sledge Mate): journal, journey from Northumberland Sound to Cape Lady Franklin (p. 131-33); orders from Belcher and Richards and journal of sledge journey, Mar.-May 1854, from Baring Bay to Beechey Island and Assistance Bay (p. 343, 397, 401-407), with sledge weights. J. F. Loney (Master): Journal (1853) of sledge journey from Northumberland Sound to Depot Point on the north coast of Grinnell Peninsula 135-36); journal of local sledge journey in Baring Bay (p. 300); report (1854) of sledge journey from Beechey Island to Baring Bay (p. 444-45), with tabulation of provisions used. F. B. Herbert (Mate): orders, report and journal of his 1853 sledge journey from Northumberland Sound westward across north Bathurst Island to Point Success (p. 145-46, 163-69, 310), with sledge crew listed; orders (1854) from Belcher and report of sledge journeys from Bay to Beechey Island (p. 343, 419-20), from Beechey Island to Assistance Bay, with sledge weights (p. 388-89), and from Beechey Island to Cape Bunny via Assistance Bay (p. 353-54); sledge weights. J. Stuart's record found by M'Cormick at Baring Bay (p. 420).

7. J. B. Grove (Mate): 1853 orders (p. 264, 294-95, 309) and journals of sledge journeys from Northumberland Sound across north Bathurst to Sherard Osborn Island (p. 137-49); from Northumberland Sound north and east along

coasts of Grinnell Peninsula to Jones Sound, examining Arthur Fiord, with sledge crew and load (p. 265-80); from Beechey Island to Baring Bay (p. 295); 1854 orders (p. 343, 349-50, 392-93, 426-27) and report of journey from Baring Bay to Beechey Island, with sledge weights (p. 428-29); journals of journeys from Beechey Island to Assistance Bay. with sledge weights (p. 352-53); from Beechey Island to Assistance Bay, with sledge weights and observations on ice conditions in Wellington Channel (p. 407-410). J. H. Allard (Master): orders (1853) and journals of sledge journeys from Northumberland Sound to Cape Lady Franklin (p. 130-31), to Depot Point and Princess Royal Island at 76°57' N. 94°17′ W. (p. 134-35, 154-61); local journey near Northumberland Sound (p. 136-37), sledge crew, abstract of distances (p. 161-62); orders (1854) and report of journey from Baring Bay to Beechey Island, with abstract of distances, sledge equipment, weights and crew (p. 411-416).

8. Cmdr. W. J. S. Pullen, in charge of the North Star at Beechev Island: journal of the North Star, Apr.-Aug. 1852, on voyage from England to Beechev Island (p. 733-45), with description of damage to ship, whalers encountered, wreck of the Regalia, ice conditions, etc.; report of the stranding and recovery of the North Star at Beechey Island, 1852-53 (p. 814-29); orders (1853) from Belcher (p. 22-24); tidal measurements at Beechey Island (p. 45-47); report of sledge journey from Beechey Island to Baring Bay (p. 300-304), with abstract of times and distances; journal of the North Star Mar.-Dec. 1853 at Beechey Island, including sledge journey to Hamilton and Dundas Islands, and to Cape Becher (p. 747-57), with map at p. 745; examination of the Beechey Island area (p. 758-60); North Star under ice pressure (p. 760-65); second sledge journey to Cape Becher (p. 766-74), with track chart; arrival of Inglefield with the Phoenix and Breadalbane (p. 774), astronomic fixes (p. 774) with variation; drowning of Bellot (p. 775-82); sinking of the Breadalbane (p. 783-84); tides (p. 784), departure of the Phoenix (p. 785), sawing a channel in the ice to release North Star (p. 787-88), mean monthly temperatures at Beechey Island (p. 746, 766, 790, 794, 795, 797, 806, 807, 822); sledge journey from Beechey Island to Baring Bay (p. 790-93); and tide register (p. 793-94). Orders

1854 (p. 31-35, 344, 394, 399); report of sledge journey from Beechey Island to Port Leopold, meteorological tabulation, depots visited, documents found on Somerset Island (p. 35-40); list of stores and provisions landed at Whaler Point by the Investigator and by the Enterprise (p. 41-43); reports of traces found of Franklin's expedition (p. 56-60); report of sledge journey from Beechey Island to Cape Rennell and Whaler Point on north Somerset, records deposited, temperature register, copies of records found, stores deposited at Whaler Point (p. 355-56, 361-71); report to Belcher of the arrival of Investigator's crew at Beechey Island (p. 371); journal of the North Star at Beechey Island, Jan.-Oct. 1854 (p. 795-813), with game list; journey to Port Leopold via Capes Hotham and Rennell, with tabulation of temperature en route (p. 797-802), arrival of the Investigator's crew, medical survey of North Star personnel with few found fit (p. 803); news of the Enterprise (p. 804); the North Star refloated, Assistance and Pioneer abandoned, arrival of the Phoenix and Talbot, resupply vessels from England, departure from Beechey Island and voyage to England (p. 808-813); fold. map of Beechey Island and Erebus Bay (at. p. 794).

9. Directly under Pullen's command at Beechey Island were Lt. Haswell, S. Court (Master) and R. P. Jenkins (Mate). Lt. W. H. Haswell (Investigator): orders (1854) from Pullen (p. 442); report of brief sledge journey from Beechey Island to Cape Grinnell (p. 442); report of sledge journey from the Resolute off Cape Cockburn to Beechey Island (p. 729-30); Stephen Court: orders, 1854, from Pullen (p. 45, 387), from Belcher (p. 429) and from Richards (p. 395, 397); report of sledge journey from Beechey Island east along the south coast of Devon Island to Maxwell Bay (p. 56-57, see also p. 447-48); reports of sledge journeys from Beechey Island to Cape Hotham, with sketch plan and description of depot (p. 388, 429-31). R. P. Jenkins: orders, 1854, from Pullen (p. 350, 354), from Richards (p. 350-51, 393-94), and from Kellett (p. 443); reports of sledge journeys: from Beechey Island west to Cape Hotham on southeast Cornwallis, with sledge crew, and list of provisions at Cape Hotham (p. 351-52); from Beechey Island west to the Resolute off Cape Cockburn (p. 354-55); from Beechey Island to Baring Bay (p. 422-23, 443); lists of provisions deposited at Cape Hotham and Assistance Bay (p. 425).

#### EASTERN ARCTIC (Western Division)

10. Captain Henry Kellett, commanding the Western Division of Belcher's expedition with the Resolute and Intrepid at Dealy Island in Bridport Inlet, south Melville Island: compendium of traveling operations in spring 1853, compiled by Dr. G. F. M'Dougall, giving sledge crews, general direction of route, abstracts of times and distances, cairns built, charts compiled, game seen and shot, sledge loads, meteorological observations, remarks, etc. (p. 953-57); abstracts giving similar tabulated data for autumn 1852 and spring 1853 (p. 958); correspondence, 1853, with M'Clure regarding medical survey of crew of the Investigator (p. 69-72); report, 1853, to Belcher giving resumé of the 1853-54 sledging program (p. 73-75), release of ships from Bridport Inlet, besetment southwest of Cape Cockburn (p. 76-79), list of provisions and clothing at Dealy Island, scale of victualling, provisions deposited near Fife Harbour, Cape Cockburn, Assistance Harbour, north coast of Melville Island, and Dealy Island (p. 80-83); letter of Feb. 1854 from Belcher regarding abandonment of ships (p. 47-48); Resolute and Intrepid abandoned (p. 426); state of provisions aboard these vessels (p. 85-86); schedule of traveling operations 1852-54 (p. 104); abstract of game procured by the Investigator, Resolute and Intrepid 1851-53 (p. 105); animals, game list, meat account (p. 958). Kellett had the following officers operating out of his two vessels at Dealy Harbour 1852-53, and off Cape Cockburn 1853-54: Cmdr. F. L. M'Clintock, Dr. W. T. Domville, Lts. R. V. Hamilton, G. F. Mecham, and B. C. T. Pim, together with Messrs. F. J. Krabbé, G. S. Nares, Richard Roche, and Ensign E. F. De Bray. Their reports, journals, etc. are listed in that order.

11. Cmdr. F. L. M'Clintock: orders from Kellett and report of cart journey, Sept. 1852, from Bridport Inlet to Heela and Griper Bay (p. 469-78), including sledge crew, meteorological observations, astronomic fixes, topographical descriptions, snow-filled ravines and ice caves (p. 476), geological observations, etc., with track chart at p. 470; report of sledge journey, Oct. 1852, from Dealy Island overland to Heela and Griper Bay, with meteorological observations, flora, fauna, geology, etc. (p. 587-96); including

abstract of journey; orders (1853) from Kellett, sledge crews, and journal of a journey Apr.-July 1853 (p. 540-87) from Dealy Island overland to Hecla and Griper Bay, thence along the coast around northwestern Melville Island, south into Kellett Strait across Purchase Bay, returning to the north tip of Eglinton Island, down part of the west coast and across Crozier Channel to Point Wilkie on Prince Patrick Island; after tracing Intrepid Inlet, M'Clintock continued northeastward to the north tip of Prince Patrick Island by way of the Polynia Islands, and continued southwestward along the west coast, across Satellite Bay to M'Clintock Point; he returned along much of the same route but touched Emerald Isle on the passage from Giddie Point to Cleverly Point; track chart at p. 540; the journal contains meteorological observations, flora and fauna, topographical descriptions, geological observations, and detailed astronomic observations, bearings, etc., discovery of a Parry document of 1820 at Point Nias (p. 581), abstract of times and distances; at end are tabulations of astronomic observations, mean, maximum and minimum temperatures, also list of game seen and killed (p. 585-87); orders from Kellett and report of a return dog-sledge journey 460 miles, Apr. 13-28, 1854, from the Resolute and Intrepid off Cape Cockburn eastward to Beechey Island and north to Baring Bay, west Devon Island, to communicate personally with Belcher prior to abandoning the ships (p. 730-32).

12. Dr. W. T. Domville: orders from Kellett and Pim (p. 664, 665, 672) and report of a sledge journey, Mar.-Apr. 1853, with Pim southwestwards along coast of Melville Island to lay a depot at Providence; the start across M'Clure Strait, damage to the sledge necessitating return to the Resolute, sledge crew (p. 664-69); temperature Mar.-Apr. 1853, aboard the Investigator at Mercy Bay, and the Resolute at Dealy Island, 12 observations daily (p. 670-71); report of sledge journey, May-June 1853, from Dealy Island southwestwards along coast of Melville Island to Cape Dundas and across Banks (now M'Clure) Strait to Mercy Bay (p. 672–77), with observations on geology, ice conditions, medical survey aboard the Investigator, scurvy symptoms and treatment, invalids, fauna, flora, living off the land, sledge crew, etc.; fold. map at p. 664; traces found at Beechey Island of Franklin's expedition (p. 57); orders from Kellett and report of a sledge journey in May 1854, moving the sick from the Resolute off Cape Cockburn eastward to

Beechey Island (p. 416-17).

13. Lt. R. V. Hamilton: orders and journal (p. 617-23) of a sledge journey, Sept.-Oct. 1852, from Dealy Island southwestwards along the coast of Melville Island to Cape Providence, with track chart on which open water spaces are plotted (at p. 618); meteorological observations, geology, flora, fauna and ice conditions, contents of depot at Fife Harbour and Cape Providence, abstract of the journey; remarks on equipment and increased weights of clothing and equipment following the journey (p. 623-24); orders, report and journal (p. 624–41) of a sledge journey, Apr.-June 1853, from Dealy Island overland to Hecla and Griper Bay, and around Sabine Peninsula, with fold. track chart at p. 616; the journal (p. 627-41), includes meteorological and detailed astronomic observations, topographic and geological descriptions, examination of Vesey Hamilton Island, flora, fauna, etc., meetings with Richards (p. 633) and Osborn (p. 634-35) from the Assistance, remarks on provisions and equipment, sledge crew, sledge weights and abstracts of distances (p. 641); orders from Kellett and report of sledge journey, May-June 1854, from the Resolute off Cape Cockburn on southwest Bathurst Island to Byam Martin Island and westward along the south coast of Melville Island to Cape Bounty, returning eastward to Beechey Island (p. 723-24); report of a sledge journey from the Resolute off Cape Cockburn eastward to Beechey Island (p. 348); report of sledge journey, Mar.-Apr. 1854, from the Resolute eastward to Beechey Island and north to Baring Bay (p. 724-28), including observations on meteorology, ice conditions, fauna, etc., sledge crews and abstract of distances with return journey to the Resolute; report of sledge journey from Beechey Island to Assistance Bay on south Cornwallis (p. 728-29).

14. Lt. G. F. Mecham: orders from Kellett and report of the journey, Sept.—Oct. 1852, from Dealy Island west along south coast of Melville Island to Winter Harbour, finding M'Clure's record there, continuing overland across Dundas Peninsula into Liddon Gulf, following its south coast westward to Cape Hoppner (p. 489–91); journal of the same journey (p. 491–97), including meteorological

observations, flora, fauna, etc., also remarks on equipment; orders from Kellett and report of the Apr.-July 1853 journey (p. 498-505) from Dealy Island westward to Winter Harbour, overland to Liddon Gulf, westward along its north coast and to Capes Smyth and Russell, across Kellett Strait, along the south coast of Eglinton Island, and across Crozier Channel to Butter Bay on Prince Patrick Island; continuing westward along the south coast, around Land's End, Mecham traveled northeastward up the west coast of Prince Patrick to about Cape Andreason (71°20' N., 118°45' W.); his return journey followed the same route except he went overland from Point Tullett into Walker Inlet, north across Mould Bay, around the north end of Eglinton Island, and south to Cape Russell on Melville; large fold. map at p. 498, includes sketches of Cape Mecham, Humphries Head, Cape Cam and Cape Nares. Journal of the 1853 journey (p. 505-537), contains sledge crews, meteorological observations, flora, fauna, discovery of fossil wood (p. 522-23), numerous astronomic observations, bearings, etc., topographic descriptions and an abstract of the journey; appended (p. 537-40) are: note of cairns discovered, tabulated astronomic observations, game procured, and names given new discoveries. Orders from Kellett and report (p. 87-95, 434-36, 689-90, 703) of Apr.-June 1854 sledge journey from the Resolute off Cape Cockburn west to Cape Providence on south Melville, and across M'Clure Strait to northwest Victoria Island, through Prince of Wales Strait to Princess Royal (72°41' N., 117°50' W.) and Ramsay Islands and return touching northeast Banks Island at Russell Point, then along a similar route to Byam Martin, thence eastward to Beechey Island, with scale of victualling, abstract of distances, records of Collinson 1851-54 found at Ramsay and Princess Royal Islands (p. 91-95), including depots laid by the Enterprise; fold. map at p. 688 shows Mecham's track; journal of the same sledge journey (p. 690-706) contains sledge crews, observations on meteorology, fauna, flora, ice conditions, driftwood, description of the land, view of ice hummocks (p. 694), discovery of the Enterprise documents (p. 697-99), meeting with Hamilton and Krabbé (p. 706), and concluding remarks.

15. Lt. B. C. T. Pim: orders from Kellett and journal of sledge journey in Sept.-

Oct. 1852, from Dealy Island southwestward along the south coast of Melville Island to Cape Providence (p. 611-17), with contents of depot there (p. 615), description of the land, observations on flora and fauna, general remarks, sledge crew, and abstract of times and distances: orders from Kellett and report (p. 646-50, 684) of a sledge journey, Mar.-Apr. 1853, from Dealy Island southwestward along the coast of Melville Island to Cape Dundas, thence across M'Clure Strait to join M'Clure and the Investigator at Mercy Bay; resumé of M'Clure's activities after parting from the Herald in 1851, game seen, description of the north coast of Banks Island, ice conditions in M'Clure Strait, advantages of sledging in early spring; journal (p. 650-60) of the same journey, with observations on weather, flora, fauna, ice conditions, details of the approach to Mercy Bay and meeting with M'Clure, tabulated traveling abstract; fold. map at p. 646 shows track of the journey; report of a sledge journey, May-June 1853, from Dealy Island crossing Melville Island to Hecla and Griper Bay, past Point Nias to Cape Fisher, with remarks on geology, fauna, etc. (p. 678-80) fold. map, journal of the same journey appended (p. 680-83), including sledge crew, topographic description, geology, fauna, weather, driftwood, coal, etc., also a meeting with Richards from the Assistance, discovery of a Parry (1820) document at Point Nias, abstract of times and distances, sledge weights (p. 684–85); orders (1854) from Richards (p. 397, 398).

16. F. J. Krabbé (Master): orders from Kellett (p. 95-96, 707, 719); report of a journey, Apr.-June 1854, from the Resolute off Cape Cockburn, west to Cape Providence, thence across M'Clure Strait to Russell Point and Mercy Bay to visit the abandoned Investigator, with detailed report on the vessel (p. 96-98); abstract of distances, lists of stores and provisions landed at Mercy Bay, Princess Royal Islands, and Dealy Island; record deposited at Mercy Bay, list of sledge provisions (p. 98-101, 436-40), ration scale (p. 707). Journal of the same journey (p. 708-721) contains observations on meteorology, ice conditions, fauna and flora, topographic descriptions, notes on driftwood, geology, coal specimens collected, report on the Investigator (p. 714-16); also (at end) abstracts of time and distance, list of cairns built and records

deposited, list of game.

17. G. S. Nares, Mate: orders from Kellett, and journal of a Melville Island sledge journey Sept. 22-Oct. 16, 1852, with Mecham from Dealy Island west to Winter Harbour, overland to Liddon Gulf, and west to Cape Hoppner, with observations on meteorology, flora, fauna, etc. (p. 596-601); orders from Kellett, and journal of a sledge journey Apr. 4-May 29, 1853, with Mecham from Dealy Island westward to Winter Harbour overland to Liddon Gulf, thence westward along the north coast to Cape Russell and Eglinton Island (p. 601-610), track chart faces p. 600; report of sledge journey June 3-11, 1853, from Dealy Island westward to Winter Harbour and overland to lay depot for Mecham in Liddon Gulf (p. 610); report of sledge Mar. 7-Apr. 12, 1854, with journey Hamilton from Beechey Island westward Resolute off Cape Cockburn (p. 729). Richard Roche, Mate: orders from Kellett and Pullen, and report of sledge journey from Dealy Island eastward to Beechey Island (p. 685-87) with list of game killed, followed (p. 688-89) by journal of the same journey. Ensign E. F. De Bray: orders from Kellett and journal of a sledge journey Sept. 22-Oct. 8, 1852, with Pim from Dealy Island southwestwards along coast of Melville Island to lay a depot at Cape Providence, observations on meteorology, fauna, ice conditions, etc., abstracts of times and distances, sketch views of Capes Bounty and Providence, etc. (p. 660-64); orders from Kellett and M'Clintock and report of a sledge journey Apr. 4-May 18, 1853, with M'Clintock from Dealy Island overland to Hecla and Griper Bay, northwestwards along coast of Melville Island, and south along the west coast to Cape De Bray, with observations on meteorology, flora, fauna, etc., abstracts of the journey, sledge weights, and remarks on provisions, bedding, clothing, and rations (p. 478-89), track chart faces p. 478; orders from Kellett and report of a sledge journey May 8-23, 1854, from the Resolute to Beechey Island (p. 421-22).

18. Capt. E. A. Inglefield with the Phoenix: orders (1854) from the Admiralty and progress reports (p. 1, 3-11) from voyage of the Phoenix to resupply Belcher's expedition base at Beechey Island: from Disko, and from Fourth Island, with track chart of the Phoenix east of Disko, description of Greenland coal deposits and engineer's report on the

coal (p. 6-8); continued voyage of the *Phoenix* (and the *Talbot*) north to Melville Bay, with description of the rookeries, entrance to Lancaster Sound, visit to the *North Star's* depot in Navy Board Inlet, and contact with the *North Star* at

Beechey Island.

19. Dr. John Rae's account of expedition from Repulse Bay (66°20' N. 86° W.) north and west to Rae Strait (p. 831-58) contains natives' report of starving Franklin survivors seen near the mouth of the Back River in 1850 and corpses discovered, also list of Franklin relics obtained by Rae (p. 831-33, 844); report of a boat voyage from Chesterfield Inlet to Repulse Bay in 1853 to winter quarters (p. 835); overland journey in the spring, Mar. 31-May 26, 1854, to Committee Bay, west across Simpson Peninsula to Pelly Bay, along Simpson Lake to Castor and Pollux River, Murchison River, etc., and to Shepherd Bay and Rae Strait (p. 837-43), with many astronomic fixes, observations on flora, fauna, and natives: descriptions, topographical features named, etc., fold. map at p. 830; correspondence with Hudson's Bay Co. (p. 833, 835, 844-58).

## WESTERN ARCTIC (Bering Strait)

Capt. R. Collinson with the Enterprise: brief report of 1851-54 voyage of the Enterprise (p. 943-44) from Port Clarence along the Alaskan coast past Point Barrow, along the continental coast eastward, across Amundsen Gulf into the north end of Prince of Wales Strait, returning to winter at Ramsay Island; sledge journeys reached Winter Harbour on Melville Island, north Victoria Island and Prince Albert Sound; moved east in the summer of 1852 to Cambridge Bay; a sledge party traced the east coast of Victoria Island north to 70°26' N.; returning westward, the Enterprise spent the third, 1853-54, winter on the north coast of Alaska and returned to England the following summer. Narrative containing more detailed account follows (p. 944-49) with fold. map at p. 943; tabulated data aboard the Enterprise, with monthly figures for number of sick, maximum, minimum, and mean temperatures, days above and below zero, days mercury frozen, ice thickness, maximum, minimum and mean barometric pressure, and latitude and longitude of wintering stations (p. 950); Franklin relics found near Cambridge Bay (p. 949, with illus. facing); records found on Princess Royal

Islands, on the east coast of Victoria Island, and at Camden Bay (p. 951); report (1854) of the voyage of the Enterprise from Port Clarence to Point Barrow, with numerous observations on the natives (p. 952).

21. Capt. Wallace Houston with the Trincomalee: voyage to Bering Strait to

join the Rattlesnake (p. 859-60).

22. Capt. Robert M'Clure with the Investigator: records deposited at Princess Royal Islands and Mercy Bay, with lists of stores and provisions (p. 83-85); arrival of Pim at Mercy Bay from Dealy Island in 1853 (p. 646-60); medical surveys of the crew of the Investigator (p. 52-53, 69-72, 372, and 674-75); temperature records at Mercy Bay, Mar.-Apr. 1853 (p. 670); M'Clure's proceedings from April to June 1853 with details leading to abandonment of the Investigator in Mercy Bay (p. 107-110), including list of provisions and stores at Mercy Bay and record deposited (p. 108-109); arrival of the Investigator's crew at Beechey Island (p. 371); report (1854) by Krabbé on the Investigator (p. 96-98).

23. Cmdr. Rochfort Maguire with the Plover: account (p. 906-916) of the 1853-54 voyage of the Plover from Cape Clarence through Bering Strait to Point Barrow winter quarters, sledge journey east to Cape Halkett, manners and customs of natives (p. 908-909), sledge journey to Point Berens, and to Wainwright Inlet, return of the Plover to Port Clarence and outward trip (1854) to Point Barrow, return of the Enterprise and resumé of Collinson's activities (p. 914-15); return to Port Clarence, return voyage to San Francisco, ship's survey of the Plover (p. 916). Detailed observations on the Eskimos and northwest coast of Alaska are given by Dr. John Simpson (p. 917-42) cf. No. 16122 of Arctic Bibliography, with fold. map showing Eskimo place names (at p. 916), and sketches of winter hut at Hotham Inlet

24. Cmdr. Henry Trollope with the Rattlesnake: proceedings aboard the Rattlesnake at Port Clarence from Sept. 1853 to June 1854 briefly reported (p. 899-900), and more detailed report (p. 861-68) including sledge journeys to Cape Prince of Wales (p. 863), to Kotzebue Sound (p. 865), arrival of the Trincomalee (p. 868), natives, etc.; proceedings (1854) aboard the Rattlesnake on the voyage through Bering Strait to Point Barrow, and return; report of return of the Enterprise to Port Clarence, with brief summary of Collinson's activities, and return of Rattlesnake south to San Francisco (p. 900-904); 1854 orders to Hobson and Bourchier and journals (p. 881-98) of Feb.-Mar. 1854 sledge journey from Port Clarence across Seward Peninsula at the entrance to Eschscholtz Bay in Kotzebue Sound to Chamisso Island, with observations on natives, weather, flora, fauna, topographical description, account of altercations with natives, etc.; journal of sledge journey Jan. 1854, from Port Clarence to Cape Prince of Wales (p. 868-79), with topographical descriptions, observations on weather, ice conditions, driftwood, dog food, etc., being especially rich in observations on the customs, manners, habitations, appearance, hospitality, etc. of the natives; journal of Gilpin on the same journey follows (p. 879-81).

25. Maps (37), most from the Admi-

ralty Hydrographic Office:

Discoveries by the squadrons under the orders of Captains Belcher, the Assistance, Kellett, Resolute, Collinson, Enterprise, and M'Clure, Investigator up to 1854 (fold. frontispiece).

Track of the Phoenix around Disko Is-

land, West Greenland (p. 5).

North extremity of Spit Island, with islet, west of Grinnell Peninsula, northwest Devon Island (p. 125).

Sector of Grinnell Peninsula coast, northwest Devon Island, between Barrow Bay and Cape Majendie, by J. P. Chevne

(at p. 152).

Coast line searched by the Western Division of sledges from Northumberland Sound under Cmdr. Richards, and sledge track of Sherard Osborn (fold. map at p. 188).

"References, discoveries and explorations, 1852": discoveries of Belcher, Kellett and M'Clure, with lists of supplies in man-days at Dealy Island, Fife Point and Mercy Bay depots, as well as those aboard the Investigator (at p. 214).

West shores of Queens searched and explored by Sherard Osborn, June-July 1853 (fold. map at p. 214).

Eye sketch of the Hooker Islands,

Queens Channel (p. 239). Track chart of a boat party from Beechey Island to Cape Bowden commanded by W. B. Shellabear, Sept. 8-11, 1853 (at p. 289).

Wellington Channel with tracks of two traveling parties under Shellabear from Beechey Island: to Point Phillips on east Cornwallis, and to the Assistance in Baring Bay near Point Eden on west Devon (at p. 297).

Sketch map of Cape Lady Franklin on northeast Bathurst Island and islands to

the westward (on p. 454).

Sketch map of West Water Sound, west shore of Queens Channel off north-east Bathurst Island (p. 454).

Eye sketch of the west coast of Queens

Channel (p. 455).

Eye sketch of the west coast of Queens Channel, east Bathurst Island (p. 456). Eye sketch of the southwest extremity

of Queens Channel (p. 457).

Route of the carts of the Intrepid across Melville Island, Sept. 15-Oct. 2, 1852, under M'Clintock (at p. 470).

Route of sledge trip, west Melville Island, by De Bray, Apr. 4-May 18, 1853

(fold. map at p. 478).

Track of sledge party of G. F. Mecham, Apr. 4-July 6, 1853, with sketch views of Capes Mecham and Cam on Prince Patrick Island, Eglinton Island near Cape Nares, and Melville Island south of Humphries Head (fold. map at p. 488).

Track of sledge trip, Melville Island, under Mecham, Sept. 22-Oct. 14, 1852

(fold. map at p. 490).

Coasts discovered by M'Clintock, with his track Apr. 4-July 18, 1853 (fold. map at p. 541).

Route of sledges, Oct. 7-25, 1852, under

M'Clintock (p. 588).

Track of sledge under G. S. Nares, Apr. 4–June 14, 1853, Melville Island (fold. map at p. 600).

Track and discoveries of Lt. R. V. Hamilton, northeast Melville Island (fold.

map at p. 616).

Track of Hamilton Sept. 22-Oct. 7, 1852, south coast of Melville Island (at p. 618).

Track of sledge from Dealy Island to Mercy Bay, 1853, led by B. C. T. Pim

(fold. map at p. 646).

Track of sledges under Dr. Wm. Domville, Mar. 10-Apr. 19, 1853, May 5-June 9, 1853, part of the searching operations from the *Resolute* (fold. map at p. 664).

Track of sledge under B. C. T. Pim from Dealy Island to Cape Fisher, May 9-June 9, 1853 (fold. map at p. 680).

Track of sledge journey, Apr. 3-June 12, 1854, of G. F. Mecham, from the Resolute off Cape Cockburn through Prince of Wales Strait to Ramsay Island, and return to Beechey Island (fold. map at p. 688).

Track of sledge from the Resolute Apr. 3-June 13, 1854, F. J. Krabbé commanding the party (fold. map at p. 706).

Coast of Wellington Channel, showing tracks of Pullen's journey to the Assist-

ance Oct. 1853 (at p. 745).

Coast of Wellington Channel showing route of Pullen's second journey to Cape Becher July-Aug. 1853. (fold. map at p. 768).

Erebus Bay, Barrow Strait, surveyed by Pullen, 1854, with astro fix and

soundings (fold. map at p. 794).

Coast line of parts of north Devon, Cornwallis and north Somerset Islands, showing route of Pullen with sledge party from the North Star in Erebus Bay across Wellington Channel, Barrow Strait, to Port Leopold, and return to the ship, Mar.-Apr. 1854; distance traveled: 190 miles (at p. 797).

Map of route of Dr. John Rae from the head of Repulse Bay to Castor and Pollux River; "during this journey he obtained conclusive information of the fate of a portion of Sir John Franklin's expedition, 1854. This is an exact tracing from Dr. Rae's ms. drawing . . . John Arrowsmith . . . 20 Dec. 1854." (fold. map at p. 830).

Map to accompany J. Simpson's observations on the western Eskimos, containing many native names (fold. map

at p. 916).

Chart to illustrate the narratives of Collinson and Rae (fold. map at p. 943).

Map showing in color: discoveries of J. C. Ross, H. T. Austin, R. M'Clure, Dr. John Rae and Wm. Penny; also shows winter quarters of expeditions from 1845 to 1853, and locations of depots (fold. map at p. 958).

Copy seen: DLC.

Navy estimates for the year 1855–56 (98 p.), pub. in House of Commons' Sessional papers . . . 1854–1855, v. 31, no. 52) records, p. 77, the allocation of £2,220 in 1854–55 to the Hudson's Bay Co. for supplies to the "Overland Arctic Searching Expedition in 1851 and 1852", probably Rae's journeys as in No. 45229, 45233; and a further £3,000 allocated in 1855–56 for the expenses of a Franklin Search Expedition.

#### 45246. GREAT BRITAIN.

Estimates &c., civil services for the year ending 31 March 1856. Ordered by the House of Commons to be printed, 27 March 1855. 46 p. (Great Britain.

Parliament. House of Commons. Sessional papers, Accounts and papers, 1854-55, v. 31, no. 140, section VII) Item 43, arctic discoverers, rewards; item 44, monument to Sir John Franklin. (p. 45): 1855-56 appropriation of £5,000 to M'Clure and £5,000 to his officers and and crew for accomplishing the discovery of the Northwest Passage; an appropriation of £800 for the erection of a monument to the memory of Franklin.

# 45247. GREAT BRITAIN.

Arctic expeditions, Return to an order of the Honourable the House of Commons dated 29 March 1855, for: A return of the cost of the "Further papers relative to the recent arctic expeditions," presented to both Houses of Parliament by command of Her Majesty in January 1855; distinguishing under each head the expense of paper, printing, lithographing of charts and illustrations, and other expenses, and of the number of copies printed, and the distribution of the same. Her Majesty's Stationery Office, 13 April 1855. J. R. McCullough, Comptroller. Ordered by the House of Commons to be printed, 18 April 1855. 2 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1854-55, v. 44, no. 181) Costs of printing 2,000 copies of No. 45241, together with distribution list.

Copy seen: DLC.

#### 45248. GREAT BRITAIN.

Report of the Select Committee on Arctic Expedition; together with the proceedings of the Committee, minutes of evidence, and appendix. Ordered by the House of Commons to be printed, 20 July 1855. xx, 38 p. fold.map. (Great Britain. Parliament. House of Commons. Sessional papers, Reports from committees, 1854–55, v. 7, no. 409)

Contains list of members, report and proceedings of the committee (Mackinnon, chairman) appointed to recommend awards, if any, for Northwest Passage discovery, to be paid to M'Clure with the Investigator, Collinson (Enterprise) and Kellett with the Herald and Resolute (p. i-xix); with review of M'Clure's activities, 1850-54; and survey of acts of Parliament concerning rewards for accomplishment of a Northwest Passage. £5,000 award is recommended to M'Clure and £5,000 to the Investigator's officers and crew (p. vi, xv); Kellett's actions are commended and tribute is paid to Franklin. Arctic

Medal award is recommended to Royal Navy personnel, Hudson's Bay Company employees, crews of De Haven's ships, and those despatched by Lady Jane Franklin. Lady Franklin's letter claiming discovery of the Northwest Passage for her husband is included (p. xviii-xix, 35). Witnesses are listed (p. xx) and minutes of evidence given (p. 1-35), including that of Capt. Back (p. 1-7) on M'Clure's accomplishment of Northwest Passage, Collinson's voyage; Capt. H. Kellett (p. 4-10) on voyages of the Investigator and Enterprise, M'Clure aboard the Resolute, M'Clure's Northwest Passage; Capt. J. C. Ross (p. 7-8) on rewards for discovery of the Northwest Passage, M'Clure's voyage, voyages of the Investigator and Enterprise; Capt. John Washington, Admiralty hydrographer (p. 10-12) on Franklin's northwest passage; Capt. Robt. M'Clure (p. 13-18) his orders (1850) from Collinson, voyage of the Investigator, journey eastward to Beechey Island, Banks Island, steam power; Sir Roderick I. Murchison (p. 18-23) on the case for Franklin's northwest passage, tides at Victoria Strait, the Arctic Medal; Dr. W. T. Domville (p. 23-25): medical survey of the Investigator; Rear-Adm. W. A. B. Hamilton (p. 25-26) on Kellett's contributions to M'Clure's success: Capt. Richard Collinson (p. 27-32): resumé of his voyage in the Enterprise, separation from M'Clure, visit to Melville Island, Franklin relics found at Finlayson Islands, Collinson's northwest passage. Tabulation of arctic discoveries 1819-1854 is included (p. 33-34) showing officers and vessels by name, sailing date, wintering place, coasts discovered, and date of expedition's return. Map at end of regions from Chukotsk Peninsula eastward to Greenland shows: tracks of ships of Parry 1819-20, M'Clure in the Investigator 1850-54, Collinson in the Enterprise 1850-54, and Dr. John Rae 1854; with notes on the sea ice, and on the expeditions of M'Clure, Maguire (Plover 1852-53), and Collinson.

Copy seen: DLC.

#### 45249. GREAT BRITAIN.

Further papers relative to the recent arctic expeditions in search of Sir. J. Franklin, and the crews of . . . Erebus and Terror; including the reports of Dr. Kane and Messrs. Anderson and Stewart; and correspondence relative to the adjudication of £10,000 as a reward for ascertaining the fate of the crews of . .

Erebus and Terror. In continuation of papers presented in September 1854–5. Presented to the House of Commons, 1856. London, Harrison and Sons. vi, 95 p. 2 maps, 1 fold. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1856, v. 41, no. 2124).

Contains correspondence on: the Second Grinnell Expedition to Smith Sound and Kane Basin, with Kane's report of proceedings (p. 1-18); also on the Hudson's Bay Company's expedition under Anderson and Stewart down the Back River Anderson's report (p. 19-29); King's proposal to proceed down the Back River to Montreal Island (p. 31-34); recovery and disposal of the Resolute (p. 35-43); report on Franklin relics collected by Collinson (p. 45); correspondence on the Franklin Search reward (p. 46-91); lists of U. S. officers and men entitled to receive the Arctic Medal (p. 92-95).

 Eastern Arctic: Proceedings (p. 7-17) of the second expedition in search of Franklin, sponsored by Henry Grinnell and led by Lt. Elisha K. Kane, with the Advance; voyage from New York, May 1853 to Melville Bay, Smith Sound, and winter quarters on the Greenland coast of Kane Basin, with description of the coast, sledge journey north to Peabody Bay to lay depots, arrangements and routine aboard ship (p. 7-9); effects of low temperatures on various liquids (p. 10); minimum temperature -70° F.; death of dogs through disease; spring journeys around Peabody Bay, geological observations along the Smith Sound coast of Greenland, journey north into Kennedy Channel (p. 11-12); attempt to communicate by whaleboat with Belcher's supply base at Beechey Island (a failure), second, 1854-55, winter on short rations, outbreak of scurvy, abandonment of the Advance and retreat southward in whaleboats, with description of equipment taken (p. 13-15). The natural history collection was abandoned at Anoatok (p. 15); Kane's party reached Upernavik 83 days later, and met Hartstein (USN) off Disko. Further details and correspondence concerning Kane's return to the United States are given (p. 1-6, 17-18), also (at end of vol.) map showing his discoveries.

2. Hudson's Bay Co. expedition down the Back River under Chief Factor James Anderson and Stewart in 1855, with general correspondence (p. 19-25), and report by Anderson, including encounter with Eskimos near Garry Lake in possession of daggers, beads, files and kettles, other natives at Lake Franklin with further tools, utensils, instruments, etc., and find of many relics on Montreal Island (p. 26–27); observations on fish and animals (p. 28–29);

and animals (p. 28–29);
3. Proposal of Dr. Richard King to proceed down the Back River (p. 31–34).

4. Recovery of the Resolute (abandoned May 15, 1854, off Cape Cockburn) by whaling Capt. James M. Buddington in Davis Strait, Sept. 10, 1855, who sailed her to New London, Conn. (p. 35-43), including account published in New York Herald on Dec. 27, 1855 (p. 36-38); rights of British Government waived (p. 38-43). Report on fragments of doors and iron collected by Capt. Collinson as from Franklin's vessels.

5. £10,000 reward for discovering the fate of Franklin: offer in the London Gazette, Dr. John Rae recommended, Lady Franklin's protest against Rae and proposal that search be resumed (p. 46-63); views of Kane (p. 64), correspondence relating to claims of Rae (p. 47-64) and others: John Garland (p. 66-68), Capt. Wm. Penny, as advanced by John Roy (p. 68-69).

6. Bedford Pim claim (p. 69-73), with proposal for further search and list of sledge party equipment (p. 73-74), also (p. 75-78) Pim's journal, Mar. 10-April 29, 1850, of his journey from the Herald at Kotzebue Sound to the Russian post Michaelowski in Norton Sound; claims of Dr. Robt. M'Cormick (p. 79-87); Richard King (p. 82-85); A. K. Isbister (p. 86); Capt. E. Ommanney (p. 86-87). Award granted to Rae and his companions (p. 88-91). List (p. 92-95) of American officers and men of De Haven, Hartstein and Kane's expeditions, to receive the Arctic Medal.

Maps (two) comprise: a rough sketch map (at p. 72) traced from an original drawing of a Wainwright Inlet Eskimo, depicting a river east of Point Barrow and indicating the burial place of some white men, reported by the natives to have been killed there; and (at end of vol.) map of the Smith Sound, Kane Basin, Kennedy Channel regions, showing discoveries of the Second Grinnell Expedition, 1853–1855, under Kane.

## 45250. GREAT BRITAIN.

Correspondence respecting HMS. Resolute, and the arctic expedition. Pre-

sented to the House of Commons by command of Her Majesty, in pursuance of their address dated May 21, 1858. London, printed by Harrison and sons. ii, 40 p. map. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1857–58,

v. 60, no. 2416)

Contains brief letters and a newspaper account of the recovery of the Resolute. The vessel, abandoned by Capt. H. Kellett off Cape Cockburn, southwest Bathurst Island, in May 1854, was discovered drifting in Davis Strait off Cape Mercy in Sept. 1855, by Capt. James M. Buddington; he sailed her south to New London, where she anchored Dec. 23 (p. 1-10). Claims to the Resolute are relinquished by the British Government in favor of Buddington (a whaling captain), his associates and crew (p. 10-15, 20-21). The vessel is acquired by the U. S. Government, and presented to the British Government in a restored condition (p. 21-24, 26-34). Included is correspondence from Lady Jane Franklin protesting award of £10,000 to Dr. John Rae for ascertaining fate of the Franklin expedition, and appealing that further search vessels be despatched (p. 15-20, 24-26, 34-38). Sea and land expeditions 1818-1855, to whose members the Arctic Medal has been awarded, are listed (p. 38-39).

Copy seen: DLC.

#### 45251. GREAT BRITAIN.

Arctic expedition. Papers and correspondence relating to the equipment and fitting out of the arctic expedition of 1875, including report of the Admiralty Arctic Committee. Presented to both Houses of Parliament by command of Her Majesty. London, Eyre and Spottiswoode, 1875.

40 p. fold. col. map. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers,

1875, v. 45, no. C-1153)

Contains hydrographer's report (p. 1-17), including planning of expedition (to be headed by Capt. G. S. Nares), estimated cost, scientific program; recommendations of the Arctic Committee (p. 18-23) on vessels, route, objective (North Pole), logistics, etc. Data on dogs required, ice-masters, naturalists, boat provisions and equipment, and depots are given (p. 23-34). Specifications of HMS. Discovery, and complements of the Alert and Discovery (p. 36-

40) are included. Chart to accompany these documents is listed as No. 45252. \*\*Copy seen: DLC

## 45252. GREAT BRITAIN.

Chart to accompany Papers and correspondence relating to the equipment and fitting out of the arctic expedition of 1875. Presented to both Houses of Parliament by command of Her Majesty, London, Eyre and Spottiswoode, 1875. 2 p., col. fold. map. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1875 v. 45, no. C-1153-I)

Polar projection map of regions north of approx. 55° N., colored to show the seas first navigated by British expeditions, coasts discovered by British explorers prior to 1800, and during 1818–1859; also coasts explored by Americans, Germans, Swedes and Austrains 1855–

1874.

Copy seen: DLC.

#### 45253. GREAT BRITAIN.

Arctic expedition. Supplementary estimate of Her Majesty's Navy for the year 1874-75: an estimate of the sum required to defray the charges on account of the arctic expedition which shall come in course of payment in the year ending the 31st March 1875. Presented to Parlia-Her Majesty's command. ment by Ordered by the House of Commons to be printed, 15 February, 1875. 4 p. (Great Parliament. House of Com-Sessional papers, Accounts and mons. papers, 1875, v. 45, no. 44)

States sums appropriated for wages, stores, victuals, clothing, machinery, medical stores, instruments, etc., for Nares' expedition, together with estimates covering wages to seamen and marines in 1876–77 and succeeding years.

Copy seen: DLC.

## 45254. GREAT BRITAIN.

Arctic expedition. Further papers and correspondence of Parliamentary Paper C.—1153. of 1875. Presented to both Houses of Parliament by command of Her Majesty. Admiralty, July 1876. London, Eyre and Spottiswoode, 1876. 25 p. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1876, v. 45, no. C.—1560)

Contains Admiralty orders, May 1875, to Capt. G. S. Nares, and Nares' to sub-ordinates (p. 3-11); his report of progress to Disko, and to Upernavik, also medical

report (p. 12-15); Capt. L. F. Jones' report of the auxiliary, HMS. Valourous' voyage to Disko and return May-Aug. 1875 (p. 16-21); and Capt. Allen Young's reports of summer 1875 voyage of the yacht Pandora to Smith Sound and return with despatches from Nares.

\*Copy seen: DLC.\*

### 45255. GREAT BRITAIN.

Arctic expedition, 1875–6. Journals and proceedings of the arctic expedition 1875–6, under the command of Captain Sir George S. Nares; in continuation of Parliamentary papers, C-1153 of 1875, and C-1560 of 1876. Presented to both Houses of Parliament by command of Her Majesty, 1877. London, Harrison & Sons. vii, 484 p. illus., plates incl. fold. maps. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1877, v. 56, no. C-1638)

Contains reports of an expedition attempting to reach the North Pole by Smith Sound—Robeson Channel, and exploring adjacent coasts: HMS. (Capt. G. S. Nares) wintered at Floeberg Beach, near Cape Sheridan on northeast Ellesmere Island, with sledge parties traveling westward along the north coast, eastward to Greenland, north towards the North Pole, in addition to numerous local journeys; HMS. Discovery (Capt. H. F. Stephenson) wintered at Discovery Harbour in Lady Franklin Bay, with sledge journeys eastward to Greenland and along its north coast to Sherard Osborn Fiord, southwestward on Ellesmere to the head of Archer Fiord, westward into The Bellows, besides local journeys. After the wintering (first of two planned), the expedition returned to England because of ravages of scurvy. Reports of each ship, its sledge parties, the doctors, report on provisions and stores, also records of Capt. C. F. Hall, and account of the 1876 voyage of the Pandora are included and described in turn infra. Scientific results from the vessels en route and in winter quarters were published separately (No. 45257). Sledge parties' observations of weather, snow, ice, trail conditions, position, atmospheric phenomena, health of men, etc. are included in their reports infra, and some of the information is presented also, in different form (evidence), in No. 45256.

1. The Alert (Floeberg Beach, about two miles south-southeast of Cape Sher-

idan (82°26' N. 61°30' W.) on the northeast coast of Ellesmere Island); Nares' report of proceedings (p. 1-44); account of the voyage to Baffin Bay, Smith Sound (p. 4-8), Kane Basin (p. 8-10), Kennedy Channel to Lady Franklin Bay (p. 10-11), where the Discovery established winter quarters; the Alert continued north through Robeson Channel (p. 11-13) to winter quarters at Floeberg Beach (p. 13-16); winter activities (p. 16-20), including scientific observations, game list, and spring sledging program (p. 21); communication established with the Discovery (p. 20-22), and route located to Greenland across Robeson Channel (p. 22-23); outbreak of scurvy (p. 23); Beaumont's sledge expedition eastward along north coast of Greenland to Sherard Osborn Fiord (p. 23, 28); Fulford's and Coppinger's examination of Petermann Fiord (p. 24, 28-29); Markham's abortive attempt to reach the North Pole (p. 24-26); Aldrich's journey westward along the north coast Ellesmere Island to Yelverton Bay (p. 26-27); journey across Robeson Channel to Polaris Bay (p. 24, 28-29); decision to terminate expedition, reunion with the Discovery, voyage south along the east coast of Ellesmere, and return to England (p. 30-38).

2. North coast Ellesmere Island: sledge expedition by Lt. Pelham Aldrich westward from the Alert, along the north coast of Ellesmere to Yelverton Bay (p. 167-231), including Aldrich's report stressing deteriorating health of crew (p. 168-72); track chart (fold.) facing p. 172; report on clothing (p. 173-75); tabulated weights of sledge equipment and provisions, ration scale, sledging times and distances (p. 176-77); sledge journal (p. 178-231) with 18 sketches of features along the north coast and fold. sketch (at p. 197) of ice cliff, Cape Columbia. Relief expedition under Lt. Wm. H. May, westward to Depot Point, with tabulated weights of equipment and provisions (p. 316-20).

3. Sledge journey towards North Pole: under command of Cmdr. A. H. Markham, with support sledges (p. 118-57), proceeding along the coast northwest to Cape Joseph Henry and north over the ice of the Lincoln Sea to latitude 83°20' N. (about 30 miles offshore); tabulated weights of equipment and provisions (p. 120-23); Markham's report and sledge journal (p. 123-57) with track chart facing p. 126. Report of support sledge commanded by Dr. Edward L. Moss (p. 157-64), who accompanied Markham on

the start of his outward journey, including sledge journal (p. 160-64) to Cape Joseph Henry; fold. sketch view facing p. 163. Relief expedition under command of Lt. W. H. May (p. 313-15), west to Depot Point, including tabulated weights of equipment and provisions.

4. Eastward journeys to Greenland: sledge trips across Robeson Channel by Sub-Lt. Geo. Le C. Egerton to Repulse Harbour and return (p. 279–86), by Lt. W. H. May (p. 303–307, with 2 sheets of fold, sketch profiles inserted) and by Lt. Wyatt Rawson (p. 275-78); each, also Rawson and Egerton infra, includes tabulation of sledge equipment and pro-Rawson's journey eastward across Robeson Channel in company with Beaumont to Repulse Harbour and Cape Stanton, returning southwestward along the Greenland coast to Thank God Harbour in Polaris Bay, advancing later to meet Beaumont in Newman Bay (p. 404-418); he joined the Alert off Cape Beechey on Aug. 3, 1876; journey to mid-Robeson Channel by Egerton (p. 292-96) to take serial temperature observations, and to measure currents at different depths, and different phases of the tide.

5. Local journeys from Floeberg Beach: northwestwards: to Dumbell Bay, by Sub-Lt. G. LeC. Egerton (p. 296-99); to Depot Point, by Lt. W. H. May, with tabulated weights of sledge equipment and provisions (p. 307-313); to Cape Joseph Henry, by Lt. Pelham Aldrich (p. 64-78) with track chart at p. 78; to Cape Joseph Henry, by Cmdr. A. H. Markham (p. 78-88), with tabulated meteorological data, increase in weights of sledge equipment, and track chart at p. 88; to Cape Colan, by Lt. George A. Giffard (p. 257-59); and to Giffard Peak, by Giffard (p. 231-56), with his report, track chart (at p. 232) and sledge journal. Southeastwards: to Cape Union, by Lt. Wyatt Rawson (p. 63-64, 89-93) including meteorological data and track chart; to Lincoln Bay, by Lt. Wm. H. May (p. 300-303) with fold, sheet of sketch profiles; and to Discovery Bay, by Lt. G. LeC. Egerton (p. 104-116), including lists of clothing and equipment, ration scale, medicines, sketch of floeberg, and track chart facing p. 116. Southwards: inland sledge journey by Egerton, towards the United States Range of mountains, including 3 full-page sketches and 2 fold. sketches of topographic features seen, and tabulated weights of sledge equipment and provisions (p. 286-92).

6. The Discovery (Discovery Harbour (81°42′ N. 65°20′ W.) Lady Franklin Bay, on northeast coast of Ellesmere Island): Report of proceedings (p. 44-58) by Capt. H. F. Stephenson, including establishment of the Discovery's winter quarters, local surveys, scientific activities, spring sledging expeditions to Archer Fiord, The Bellows, and eastward to Greenland; outbreak of scurvy, game lists, coal seams, fish, etc.

7. Eastward journeys to Greenland: Journey by way of Floeberg Beach. across Robeson Channel, along the north coast of Greenland (Nyboes Land) eastward to St. George and Sherard Osborn Fiords, returning to cross Newman Bay, Hall Land, Polaris Bay, and Kennedy Channel, by Lt. Lewis A. Beaumont, Apr.-Aug. 1876 (p. 338-404). including fold. track chart at p. 358, abstract of proceedings (p. 341-58), tabulated weights of sledge equipment and provisions (p. 359, 363-64), sledge journal (p. 358-94), abstract of times and distances, angles and bearings, astronomic observations, latitudes and longitudes (p. 394-400), and progress report from Polaris Bay (p. 401-404). Journey by Dr. R. W. Coppinger, accompanying Beaumont to north Greenland (by way of Floeberg Beach) as far as Cape Stanton, thence returning southwestwards to Newman and Polaris Bays. and Petermann Fiord (p. 418-31), with 3 fold, sheets of profiles and sledge journal (p. 424-31). Coppinger's report on Petermann Fiord, May-June 1876 (p. 444-46) has 2 fold. profiles of the shores inserted, also fold. map of the Fiord. Journey by Lt. R. B. Fulford eastward to Polaris Bay, following which he accompanied Coppinger into Petermann Fiord: report, sledge journal, and angles (p. 432-43). Journeys across Robeson Channel to Polaris Bay by Archer (p. 320-22), and Convbeare (p. 452-55).

8. Archer Fiord: Journey to the head of Archer Fiord, 81°25′ N. 67° W. (p. 322-38), Lt. Robt. H. Archer's report, sledge journal, sketch of parhelion (p. 328), track chart (at p. 336), sledging abstract, astronomic observations, latitudes and longitudes.

The Bellows: Examination of this valley extending north for 15 miles from Discovery Harbour, by Sub-Lt. Crawford Conybeare (p. 97-100, with fold. sketch at p. 99), and by Archer (p. 94-97).

Local journeys around Discovery Bay: Journeys by Conybeare around Lady Franklin Bay (p. 448-51), and to Floeberg Beach along the east coast (p. 455-58). Abortive efforts to travel overland to Robeson Channel by Lt. Reginald B. Fulford (p. 100-102, with track chart facing p. 100).

9. Voyage of the Pandora, commanded by Capt. Allen Young, to Baffin Bay and Smith Sound in 1876, depositing mail for Nares at Cape Isabella, progress reports (p. 468-79), with track chart

facing p. 478.

10. Medical reports: Letter to the Director General of Medical Dept. by Dr. Thomas Colan (p. 458-63) being a narrative of the expedition's proceedings north to Floeberg Beach, with atmospheric temperature data (p. 460), sledge expeditions (p. 461), remarks on scurvy (p. 462), return voyage. Another letter to the Director General by Dr. Belgrave Ninnis (p. 464-65), with temperature data, ice thickness tabulation, and comments on scurvy. Report of condition of the northern sledge party (p. 164-66) by Dr. Edward L. Moss, with detailed description of men debilitated by advanced scurvy, starvation and exhaustion.

Clothing, equipment and provisions: Detailed report by Nares on the quality of provisions and stores supplied to his

expedition (p. 480-84).

Capt. C. F. Hall: Records found by Dr. R. W. Coppinger on Newman Bay, northwest Greenland, written by Hall in 1871 (p. 61-62, see also p. 54, 57, 321).

11. Maps (17) of: Davis Strait and Baffin Bay, showing the tracks of the Alert and Discovery (fold. map at p. 38).

Smith Sound, Kennedy and Robeson Channels, adjacent coasts, etc., showing the outward and homeward tracks of the ships, in addition to the sledge tracks of Aldrich, Markham and Beaumont (fold. map at p. 38).

Discovery Harbour, showing the winter quarters of the Discovery, by R. H.

Archer (fold. map at p. 62).

Track of sledge journey by Aldrich shows north Ellesmere coast from Black Cliffs Bay to Cape Joseph Henry, scale 2 mi: 1 in. (fold. map at p. 78).

Track of sledge parties under Markham, showing Ellesmere coast between Floeberg Beach and Cape Joseph Henry, scale 2 mi: 1 in. (fold. map at p. 88).

Ellesmere coast from Floeberg Beach southeast to Cape Union (facing p. 92). The Bellows, valley west of Discovery

Harbour, scale 2 mi.: 1 in. with track of Archer's journey (at p. 96).

Attempted sledge journey from Discovery Harbour overland towards Robeson Channel (at p. 100).

Egerton's journey along the Ellesmere coast from Floeberg Beach to Discovery Harbour (fold, map at p. 116).

Tracks on the sea ice northward to 83°20′ N. and return, made by party under Markham, from Floeberg Beach by way of Cape Joseph Henry (fold. map at p. 126).

Aldrich's journey along the north coast of Grant Land westward from Floeberg Beach to Yelverton Bay, scale 8 mi.: 1 in.

(fold, map at p. 172).

Giffard's journey westward from Floeberg Beach to Giffard Peak (at p. 232). Area southwest of the head of Ella Bay:

steep cliffs backed by hills (p. 332).

Archer's journey to the head of Archer

Fiord (fold. map at p. 336).

Beaumont's journey from Discovery Harbour to Floeberg Beach, across Robeson Channel and along the north Greenland coast to Sherard Osborn Fiord, returning to Discovery Harbour by way of Newman and Polaris Bays, scale 8 mi.: 1 in. (fold. map at p. 358).

Petermann Fiord, by Fulford (fold.

plan at p. 446).

Track of the *Pandora* from England to West Greenland (fold. map at p. 478).

Copy seen: DLC.

### 45256. GREAT BRITAIN.

Report of the Committee appointed by the Lords Commissioners of the Admiralty to enquire into the causes of the outbreak of scurvy in the recent arctic expedition; the adequacy of the . . . food, medicine, and medical comforts; and the propriety of the orders for provisioning the sledge parties. Presented to both Houses of Parliament by command of Her Majesty, 1877. London, Harrison & Sons. lv, 505 p. diagrs., fold. plate. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1877, v. 56, no. C-1722). This report was transmitted to the House of Commons as return to its order of June 7, 1877, and the transmittal letter (2 p.) pub. as no. 246 in the same vol. of Sessional papers.

Results of investigation of scurvy among personnel of spring (1876) sledging parties on the British Arctic Expedition, in the Alert and Discovery, headed by Sin George S. Nares, with purpose to attempt the North Pole via the Smith Sound-

Robeson Channel route. The enterprise was abandoned at the end of the first year (two projected) due to debilitation of crews. Report of the five-man committee presents summary of conclusions. and (p. v-xxix) Paper on scurvy by its medical members, Dr. Donnet and Fraser. They discuss symptoms, pathology, and causes of scurvy, its prevention, treatment, etc., as well as conditions on the Alert and Discovery and during the sledging operations, which led to widespread scurvy. Provisions, clothing, medicines, medical utensils and stores supplied to and brought back by the expedition are listed (p. xxxi-li) with chemical analyses

of various provisions returned. The outbreak of scurvy among sledging personnel is considered to have been primarily due to the absence of lime juice from the trail diet. Lack of sunshine during the preceding winter, damp quarters, extreme changes in temperature, and lack of fresh meat acted as contributing factors; weight of the (manhauled) sledges hastened the onset. major part of the report (p. 1-316) comprises the minutes of hearings Jan. 10-Feb. 28, 1877, in which Capt. Nares, the principal officers and some of the junior officers and men gave evidence on conditions during the expedition; and in which participants of earlier expeditions-notably Sir F. L. M'Clintock, Vice-Adm. E. Ommanney, Rear-Adm. W. J. S. Pullen, Dr. John Rae—also the Medical Director General of the Navy presented their opinions. Appended (p. 317-410) are 34 supporting documents submitted by witnesses: orders, rations, health reports, data on shipboard conditions (including air analyses), temperature, light (fold. diagr.), sledge parties, performance in relation to diet, etc. nesses (48) are listed with a précis of the evidence of each (p. 415-55); and a detailed index is added (p. 457-505). This index, unique in the Parliamentary papers on arctic expeditions, is a guide to information presented on expeditionary organization and procedures, personnel selection, logistics, supplies and equipment particularly in relation to hygiene and performance of personnel; on features of the arctic environment, darkness, ice, snow, weather, game, plants, etc.; on rations, specific items of diet, various diseases including frostbite, snowblindness, etc. On medicine generally and sledging operations, the experience of the principal Franklin search expeditions,

vessels and participants (as well as Nares' expedition) is represented and specifically indexed.

## 45257. GREAT BRITAIN.

Arctic expedition. Results derived from the Arctic Expedition, 1875–76: I, physical observations by Captain Sir George Nares, and Captain Feilden, &c.; II, medical report on the Eskimo dog disease, by Fleet Surgeon B. Ninnis. Presented to both Houses of Parliament by command of Her Majesty. London, Eyre and Spottiswoode, 1878. 156 p., 8 col. plates, 7 graphs. (Great Britain. Parliament. House of Commons. Sessional papers, Accounts and papers, 1878. v. 52, no. C-2176)

Meteorology, hydrography, soil temperatures, atmospheric phenomena, solar radiation, aurora, terrestrial magnetism, are reported in tabulated data, and excerpts from journals. Observations reported were made aboard the Alert and Discovery moving through Smith Sound, Kennedy Channel, Hall Basin, and (Alert only) Robeson Channel; and at their winter quarters on northeast Ellesmere. Both vessels traveled the western side of these waters, north- and southbound, except on the in-voyage they made traverses across Kennedy Channel. The vessels entered Smith Sound (78°25' N. 74° W.) July 29, 1875; reached Discovery Harbour (81°42′ N. 65°20′ W.), the Discovery's winter quarters, Aug. 25th; the Alert proceeded north, Aug. 28th, to winter at Floeberg Beach (82°27′ N. 61°22′ W.). Some observations reported were made in Davis Strait and Baffin Bay (59°36' N. and northward), and a few on the ice of Lincoln Sea, Markham's sledge trip to 83°20'26" N. Observations made on sledge trips from the winter bases are included in the sledgers' reports in No. 45255 supra. A report on the sledge dogs, and list of scientific papers published from Nares' expedition are appended to results from the Alert and Discovery.

Meteorology: tabulated yearly abstract Aug. 1875—Aug. 1876 of maximum, minimum and mean monthly temperatures, barometer readings, wind direction, duration and force, cloud cover, fog, precipitation, and hours in which mercury remained frozen, as observed by the Alert and by the Discovery (p. 32). Monthly abstract of the same daily observations, Aug. 1, 1875—Aug. 31, 1876, from the

Discovery en route north of 80° N. and at Discovery Harbour (p. 15-27) is followed (p. 34-46) by a similar abstract for the Alert en route and at Floeberg Beach. Abstract of daily mean temperature 1875-1876 at Floeberg Beach and Discovery Harbour and mean hourly range of temperature (p. 28-29) and daily temperature observations from the Discovery (p. 75-78), and from the Alert (p. 65-74) are given. Lower deck temperatures aboard the Alert Oct. 1875-May 1876, being maximum, minimum and mean monthly temperatures in the wardroom, mainmast, stokehold, and at three levels in the lower deck are also tabulated (p. 33). Remarks on the weather every few days are given (p. 97-106) correlating experience aboard the Alert and Discovery July 28, 1875-Sept. 1, 1876, from Smith Sound to, and in, winter quarters. The station at Discovery Harbour is noted as protected from all but southeast or west winds, and that at Floeberg Beach protected on the SSE through SW to NNW. On atmospheric pressure, abstracts are (p. 30-31) of daily mean Aug. 1, 1875-Aug. 31, 1876, and mean hourly range at Floeberg Beach and Discovery Harbour Sept. 1, 1875-Aug. 31, 1876; six-times daily observations Aug. 1, 1875-Aug. 31, 1876, as made aboard the Discovery (p. 47-50), and the Alert (p. 50-59) en route and in winter quarters are tabulated, the Alert's observations at Floeberg Beach increased to hourly Nov. 1875-Mar. 1876. Corrections for the meteorological instruments, and remarks on the observations, methods, etc., are added (p. 61-65); also (p. 107-108) on the freezing and thawing of mercury in thermometers.

Atmospheric phenomena: Astronomical and atmospheric phenomena observed from the Alert and Discovery, Sept. 1875-May 1876 are chronicled (p. 108-112) including references to mock suns, halos, pillars, etc., meteors, prismatic colors, lunar phenomena, refraction, magnetic disturbances, etc. Solar radiation observations are tabulated as made aboard the Discovery from Ritenbenk 69°45' N. north to Discovery Harbour July 17-Oct. 11, 1875 and Mar. 23-July 31, 1876 (p. 4-9) and the Alert (p. 10-14) at Floeberg Beach Sept. 26-Oct. 6, 1875 and Mar. 11-July 28, 1876. Auroras observed at both the winter bases are discussed and registered chronologically with descriptive notes by Lt. A. C. Parr (p. 113-19, 128-29) and seven colored lithographs from drawings by C. Conybeare, and P. Aldrich are included at p. 118. A report on atmospheric electricity briefly observed, July 9-Nov. 22, is also made by Parr (p. 146).

Magnetic observations: Results of magnetic observations by four expedition officers at winter quarters of the two vessels were worked out by E. W. Creak, Admiralty Hydrographic Dept. (p. 119-45). Instruments and their housing (including snow house) are described. Mean values of declination, inclination, unifilar horizontal force, and total force are presented and discussed for Floeberg Beach (82°27'02" N. 61°22' W.) and Discovery Harbour (81°44' N. 65°03'44" W.) observatories. Disturbed days are noted and disturbances analyzed. Appended are tabulations of observations at both stations and seven charts on which the results are plotted.

Hydrography: thickness of salt-water ice frozen during one season, at Floeberg Beach and Discovery Harbour, is correlated (p. 3-4) with that in six other localities in Greenland and Canadian waters. Floeberg Beach, a sheltered station was in good agreement with other records; but Discovery Harbour and Robeson Channel ice was less thick due to tidal currents. Temperature and specific gravity of the sea surface are reported from Kap Farvel northward in Davis Strait, Baffin Bay, Smith Sound, Kane Basin with tabular data (p. 78-84); observations on the specific gravity of the sea water by Buchanan's (Challenger) method, and chlorine estimations by Dr. E. L. Moss are tabulated (p. 85–87) from 58°39' N. to 82°27' N. Surface and deep-sea (to 275 fathoms) temperature observations at 28 stations mostly off east Ellesmere in Smith Sound (79°-79°50′ N.) but extending from 59°36′ N. to 83°20'26" N. are presented (p. 88-96) and data tabulated.

Soil temperature: observations at Floeberg Beach and Discovery Harbour (p.

Dog disease: Eskimo dog disease, its symptoms, treatment and pathology, by Belgrave Ninnis (p. 147-54) is based on author's (medical doctor) observation of 25 dogs taken aboard the Discovery at Ritenbenk, West Greenland. habits, onset and course of disease, post mortem examinations (16 cases) are described in turn. The disease is distinguished from rabies, and reported as characterized by ulcerations of the intestines of undetermined cause.

List (p. 155-56) of 36 papers published in connection with the natural history results of the expedition. Most of these papers, and others not listed, have been abstracted in earlier volumes of Arctic Bibliography, the remainder to be so in v. 9; all appear in Arctic Bibliography indexes under Expeditions: British Arctic Expedition, 1875–1876.

END OF BRITISH PARLIAMENTARY PAPERS

45258. GREAT BRITAIN. AIR MINISTRY. Aircraft operation under cold weather conditions, volume 1, 2nd edition, preliminary issue, Sept. 1940. London, reprinted June 1941 with amendment lists nos. 1 and 2, incorporated. iv, 24 p. illus., diagrs., tables. (*Its:* Air publication 1441.)

In two chapters: the first dealing with the maintenance and operation of the engine, and the second with that of the airplane as a whole. Particular emphasis is placed on care of the cooling system. Cold-engine starting techniques are outlined, and the amount of priming required for different type engines is tabulated. Protection of the airplane from snow and ice, and general maintenance of the electrical and mechanical systems in cold climates are discussed.

45259. GREAT BRITAIN. HYDRO-GRAPHIC DEPT. Bering Sea and Strait pilot, comprising the north-western and northern coasts of Alaska from Cape Douglas to Demarcation Point, the northern coast of Canada from Demarcation Point to Cape Bathurst, the Aleutian Islands, and the north-eastern coast of Siberia from Mys Shipunsky to Mys Otto Shmidt. 3rd ed. London, Hydrographic Dept., Admiralty, 1954. liii, 634 p. approx. 175 illus., charts (1 fold.), diagrs., Prepared by F. M. Hodgson. Supplement no. 1, corrected to 15th June, 1956 (15 p.) prepared by H. V. Silk.

Basic work, superseding No. 6097 and supplements; with additions to glossary of Russian-English terms, and a Russian transliteration table; expanded section on ice terminology with photo-illus. of many terms; formation and movement of sea ice and ice navigation (p. 18-47); U. S. S. R. signals and buoyage system, also regulations for vessels under conduct of Russian ice-breakers (p. 55-70). Climate and weather are reviewed with tables of climatic data for 24 localities and charts of sea surface temperature (p. 73-110). The regional information is similar though usually more extensive than in the preceding edition, particularly for Afognak, Kodiak, Trinity, Aleutian, and Bering Sea islands.

Chapters on Afognak, Kodiak and Trinity Islands (p. 111-94); Alaska Peninsula, out-lying islands, southern coast of Unimak (p. 195-280); Aleutian Islands (p. 281-375); islands in Bering Sea, western coast of Alaska: Cape Saricheff to Cape Espenberg (p. 376-426); northwestern and northern coasts of Alaska, northern coast of Canada: Cape Espenberg to Cape Bathurst (p. 427-45); Ostrova Komandorskiye, eastern coast of Kamchatka and Siberia, Mys Shipunskiy to Mys Faddeya (p. 446-534); Anadyrskiy Zaliv, western shore of Bering Strait, Mys Chukotskiy to Mys Uelen (p. 535-88). Appended are U.S. inland rules of the road; ports available for underwater repairs, principal ports, with depths, etc.

Supplement includes corrections and additions to ice terminology, information on ice accumulation on ships during winter gales, and seven new and altered geographical names. *Copy seen:* DN-HO.

45260. GREAT BRITAIN. HYDRO-GRAPHIC DEPT. HMS. Vidal oceanographical log, Greenland Sea (Norway), Aug.-Sept. 1955. [London, 1956?] 2 v. (unpaged). fold. chart in each vol. Typescript. (H. O. no. H3111/55).

Contains data collected at 91 stations in the Greenland and Barents Seas, during two cruises by the British survey ship Vidal. Data from stations 1-50 off the northernmost Norwegian-Kola Peninsula coasts (approx. 67°-75° N. 15°-50° E.) are in v. 1; data from stations 51-91, off northwest Norway (approx. 65°-72° N. 1°-15° E.) in v. 2. For each station the following information is given: position (also shown on track chart), date and time, depth and nature of bottom, sea surface temperature and color, weather and sea conditions, age of moon, depths of sampling bottles, subsurface water temperature, salinity.

45261. GREAT BRITAIN. HYDRO-GRAPHIC DEPT. Supplement no. 2, 1956, relating to the south and east coasts of Korea, east coast of Siberia and Sea of Okhotsk Pilot, fourth edition, 1952, corrected to 23rd April, 1956. London, Hydrographic Dept., Admiralty, 1956. 33 p. Prepared by H. V. Silk.

Contains additions, deletions, and alterations to No. 34994 of Arctic Bibliography, superseding Supp. no. 1 (1954). Includes all information affecting this pilot contained in Notices to mariners up to and including no. 1019 of 1956. Approx. 250 ice (and associated) terms and 96 new and altered geographical names are listed.

Copy seen: DN-HO.

45262. GREAT BRITAIN. HYDRO-GRAPHIC DEPT. Supplement no. 3, 1955, relating to the Arctic pilot, vol. II, fifth edition, 1949, corrected to 30th May, 1955. London, Hydrographic Dept., Admiralty, 1955. 41 p. 12 illus. Prepared by C. A. Bamford.

Contains deletions, additions and alterations to No. 6095 of Arctic Bibliography, superseding Supp. No. 2, 1953. Includes all information affecting this pilot contained in Notices to mariners up to and including no. 1329 of 1955; 87 ice (and

associated) terms and 36 new and altered geographical names are listed.

45263. GREAT BRITAIN. HYDRO-GRAPHIC DEPT. Supplement no. 5, 1956, relating to the White Sea pilot, first edition, 1946, corrected to 25th February, 1956. London, Hydrographic Dept., Admiralty, 1956. 91 p. Prepared by J. N. Tait.

Copy seen: DN-HO.

Contains additions, alterations, and deletions to No. 6103 of Arctic Bibliography, superseding Supp. no. 4 (1954). Includes all information affecting this pilot contained in Notices to mariners up to and including no. 498 of 1956; 120 new or altered geographical names are listed.

Copy seen: DN-HO.

45264. GREAT BRITAIN. MINISTRY OF AGRICULTURE, FISHERIES AND FOOD. FISHERIES LABORATORY, Lowestoft. Hydrographical observations made by the research vessel 'Ernest Holt' in 1949, 1950, 1953. [Lowestoft, 1956?.] 3 v.: 112, 150, 160 p. Mimeographed. 9 refs.

Contains tables of data collected on (altogether) 25 cruises during Jan.— Nov. 1949, Jan.—Nov. 1950, and Feb.— Dec. 1953, in eastern Greenland Sea, mainly in the Bjørnøya fisheries region north to about 77° N. Several hundred oceanographic stations were occupied, and for each are given date and time, geographical position, sonic depth, weather and sea conditions; data are presented on observed, interpolated and calculated values of temperature, salinity, density, dissolved oxygen and phosphates at various depths. Hydrographic equipment and procedure were described in No. 40111 of Arctic Bibliography.

45265. GRECHISHKIN, D. K. Vlifanie iskusstvennof gipotermii na klinicheskoe techenie ėksperimental'nogo sepsisa. (Éksperimental'nafa khirurgifa, 1956. god 1, no. 3, p. 33–37, tables.) 16 refs. Text in Russian. Summary in English. Title tr.: The influence of artificial hypothermia upon the clinical course of experimental sepsis.

Account of observations on rabbits infected with Staphylococcus aureus. When made hypothermic shortly before infection, they presented a "forme fruste" of sepsis and their rate of survival was double that of controls. Cooling 24 hrs. after infection had no significant effect on survival and course of infection and repeated cooling produced similar results.

45267. GREEN, L. H., and K. C. Mc-TAGGART. Structural studies in the Mayo District, Yukon Territory. (Geological Society of America. Bulletin, Dec. 1956. v. 67, no. 12, pt. 2, p. 1701–1702.)

Abstract of paper submitted for Society meeting in Minneapolis, Oct. 31–Nov. 2, 1956. Mapping of a large-scale recumbent fold involving Precambrian (?) slate and quartzite in the Davidson Mts. (64°05′ N. 135°10′ W.) supports hypothesis that the more complex structures of Keno and Galena Hills to the south include attenuated recumbent folds sepa-

rated by thrust zones. Trends of fold axes and other structural features are noted.

**45268. GREEN, PAUL L.** Radio communications with ice island. (*In:* Alaskan Science Conference . . . 1952. Pro-

ceedings, pub. 1954, p. 218.)

Operations were successful with a 75-watt transmitter, which was later replaced by one with a tuning range from 2–18 mc and an output of 400 volts. On all frequencies used, more stations were heard than contacted. Stations above a parallel running through Fairbanks around the world were much more easily heard and contacted than those south of this parallel. The system of antennas used is described. Daily voice contacts were made with amateur radio operators in Alaska using the 14 mc. band or on the MARS frequency 14405 kc.

**45269.** GREENBERG, MILTON, and A. M. GERLACH. Air Force in the International Geophysical Year. (Air University quarterly review, Spring 1956. v. 8, no. 4, p. 70–84).

A brief summary is given of each of the scientific areas of this third international scientific year, and related participation by the U.S. Air Force is emphasized. The arctic regions have been designated as a geographic area of special effort during the IGY. The U.S. Army will operate a rocket-launching facility at Fort Churchill. Related scientific facilities and accommodations for about a hundred scientists will also be provided. Approximately 100 rocket flights will be made from this site with several U.S. agencies participating. The geomagnetism program will be emphasized in and near the auroral zone in Alaska. Spectrographs, visual observations, and radio astonomy will be employed for aurora and airglow studies at Thule. An extensive flight program over the Arctic with ionosphere recorders is planned. The cosmic-ray program will include, among other countries, Canada, Alaska, and Greenland. Copy seen: DLC.

GREENBLATT, MILTON, see Plutchik, R., and M. Greenblatt. Temperature changes . . . skin . . . 1956. No. 47375.

45270. GREENE, CHARLES TULL, 1879— . Synopsis of the North American flies of the genus Scellus. (U. S. National Museum. Proceedings, Sept. 9, 1924. v. 65, art. 16, no. 2529, p. 1–18, 3 plates.) 9 refs.

Contains a historical outline of this genus, a key to the males and description of eight species. S. spinimanus, S. filiferus and S. avidus, all native to Fort Resolution, Mackenzie District, are included.

Copy seen: DLC.

**45271. GREENE, EDWARD LEE, 1843–1915.** A decade of new Pomaceae. (Pittonia, Jan.–Mar. 1900. v. 4, pt. 22, p. 127–31.)

Includes a description of Amelanchier gormani, a shrub obtained by M. Gorman,

at Yes Bay, Alaska, in 1895.

Copy seen: DLC.

**45272. GREENE, EDWARD LEE, 1843–1915.** A fascicle of new Arnicas. (Pittonia, Dec. 1900. v. 4, pt. 23, p. 159–74.)

Contains descriptions and distributional data on 24 species, among them Arnica lessingii, "a common and beautiful species of Alaskan shores and islands," and A. attenuata, collected on Lewis River, June 13, 1899, by M. W. Gorman.

Copy seen: DLC,

**45273. GREENE, EDWARD LEE. 1843–1915.** A fascicle of new violets. (Pittonia, Jan.–Apr. 1899. v. 4, pt. 20, p. 3–9.)

Contains descriptions and critical notes on 11 species, among them Viola mistassinica occurring in Labrador and the Hudson Bay region. Copy seen: DLC.

**45274. GREENE, EDWARD LEE, 1843–1915.** A fascicle of Senecios. (Pittonia, Jan.–Mar. 1900. v. 4, pt. 22, p. 108–124.)

Contains descriptions of 26 species from various regions, among them Senecio imbricatus collected at Reindeer Station, Port Clarence, Alaska, by J. T. White on Sept. 9, 1894.

Copy seen: DLC.

**45275. GREENE, EDWARD LEE, 1843–1915.** New or noteworthy species, III, XII, XIV, XV, XVIII, XX, XXII, XXVII. (Pittonia, 1888, v. 1, p. 215–25; 1892, v. 2, p. 222–33; p. 293–98; 1896–98, v. 3, pt. 13, p. 13–28; pt. 16, p. 154–72; pt. 17, p. 246–52; pt. 18, p. 306–311; 1900, v. 4, pt. 22, p. 146–58.)

a

Thirty contributions, pub. 1887-1903,

give descriptions, critical notes and distributional data on about two hundred flowering plants from various regions of North America. In the numbers listed above, some 20 species native to Alaska and northern Canada are included. The numbers not listed do not deal with materials from the far North.

Copy seen: DLC.

45276. GREENE, EDWARD LEE, 1843–1915. New species of *Antennaria*. (Pittonia, July-Dec. 1899. v. 4, pt. 21, p. 81–85.)

45281. GREENE, EDWARD LEE, 1843–1915. Some new or critical Ranunculi.

(Pittonia, Jan.-Mar. 1900, v. 4, pt. 22, p. 142-46.)

Six species of Ranunculus are described and discussed, among them R. vicinalis obtained at Fort Selkirk on the Yukon River, in dry gravelly soil on June 9, 1899, by M. W. Gorman.

Copy seen: DLC.

**45282. GREENE, EDWARD LEE, 1843–1915.** Some west American Asperifoliae. (Pittonia, 1887. v. 1, p. 8–23.)

Contains descriptions of three genera and 26 species of this (borage) family, among them Allocarya plebeia (p. 16-17) occurring on the shores of the Aleutian Islands. Copy seen: DLC.

45283. GREENE, EDWARD LEE, 1843–1915. Studies in the Compositae, VII. (Pittonia, Feb.—Apr. 1898, v. 3, pt. 18, p. 264–98.)

Contains descriptions, critical notes, and distributional data on some 80 species of this family; a genus (Rainiera) and seven species are described as new. At least eight of the species are native to Alaska, Aleutian Islands, northern Canada, Lapland and Greenland. Other parts (I-VI, VIII) of this paper do not contain arctic material.

Copy seen: DLC.

**45284. GREENE, EDWARD LEE, 1843–1915.** Studies in the Cruciferae, II–IV. (Pittonia, 1897, v. 3, pt. 17, p. 252–54; (III) 1900, v. 4, pt. 23, p. 187–207; (IV) 1901, v. 4, pt. 25, p. 307–315.)

Contains descriptions, critical notes and distributional data on about 45 species of this family, 24 of them described as new. Included are Nesodraba grandis from St. Paul Island in Bering Sea, N. siliquasa native of Unalaska Island (II: p. 253); Arabis holboellii described from Greenland material (III: p. 187–88) and Draba oligantha n. sp. collected at Disenchantment Bay by F. Funston on Aug. 9, 1892 (IV: p. 313–14) Pt. I of this series does not contain arctic material.

Copy seen: DLC.

**45285. GREENE, EDWARD LEE, 1843–1915.** *Taraxacum* in North America. (Pittonia, Jan. 1901, v. 4, pt. 24, p. 227–33.)

Contains descriptions of eight species of dandelions, among them T. chamissonis, the most common species of the Alaska and Bering Sea shores and islands, and T. mutitum from Johnson River, Alaska

collected on June 27, 1890, by Capt. E. F. Glenn. Copy seen: DLC.

GREGORY, ROBERT A., see Godman, R. M., and R. A. Gregory. Soil-site relationships . . . 1956. No. 45147.

45286. GREÏVER, N. S. Gidrometallurgicheskafa pererabotka molibdenovykh kontŝentratov Takhtarvumchorrskogo mestorozhdenifa. (In: Khibinski apatity, 1933. t. 6, p. 147–53, graphs.) Text in Russian. Title tr: Hydrometallurgical refining of molybdenum concentrates of Takhtarvumchorr de-

posits.

Technological processes of refining are described, with consideration of the adverse relation of carbon content to amount of molybdenum extraction (5 percent Mo, 19 percent C: extraction 45 percent, but for 2 percent Mo. 6 percent C: extraction 90 percent). The results of the following processes are analyzed: (1) hydro-metallurgical firing at various temperatures with sodium carbonate, potassium nitrate, sodium chloride, sodium bisulfate; (2) leaching by sodium carbonate, ammonia; (3) purification of solution from phosphorous, arsenic and other impurities; and (4) precipitation of final product. The economics of these processes are discussed by P. F. Semerov and M. N. Dzhakson (No. 47897).

45287. GREKOV, V. I. Naibolee rannee pechatnoe izvestie o pervoī Kamchatskoī ėkspeditsii, 1725–1730 gg. (Akademiſā nauk SSSR. Izvestiſā, seriſā geograſcheskaſā, Nov.—Dec. 1956, no. 6, p. 108–112.) 20 refs. Text in Russian. Title tr.: The earliest published information about the first Kamchatka Expedition, 1725–1730.

A note in the Danish newspaper Nye Tidende in 1730, and a summary of Bering's report published in Du Halde's Description . . . de la Chine . . . Paris, 1735, have been regarded as the earliest printed accounts of the first part of the Great Northern Expedition. Recently a brief report is found to have been published in the Russian newspaper Sanktpeterburgskie vedomosti, no. 22, Mar. 16, 1730, only few days after Bering's return. This seems to be the earliest printed record of the expedition and the source of the accounts published abroad. covery of a strait separating Asia from America is briefly discussed.

45288. GRENAGER, BIRGER. Kvantitative undersøkelser av tang og tare. (Blyttia, 1953. bd. 11, hefte 4, p. 121–29.) Text in Norwegian. Summary in English. *Title tr.:* Quantitative survey of seaweed.

Includes brief reference to investigations in northern Norway, to methods used for quantitative determinations by the Institute for Seaweed Research, and to Printz's report on exploitation of seaweed, g. v. Copy seen: DLC.

45289. GREY, MARION. The distribution of fishes found below a depth of 2000 meters. (Chicago. Natural History Museum. Fieldiana: Zoology, July 30, 1956. v. 36, no. 2, p. 73–337, 3 tables.) 106 refs.

Account of 260 species reported from below 2000 m. in two parts. The first, general part (p. 77-93) deals with terminology, fishes found below 2000 fathoms, their character, endemism, etc., bathypelagic fishes. The second part (p. 94-279) lists the species, distribution, synonymy, etc. Seven arctic species, five of them endemic, are included. All the fishes considered in the study live in permanent darkness at temperatures close to the freezing point. Appendices show the vertical distribution of species and lists of benthic and bathypelagic fishes found below 1000 fathoms (ca. 2000 m.). Copu seen: DA.

GRICE, P. F., see Rodriguez, R. W., and others. Hypothermia . . . complications . . . control. 1956. No. 47629.

45290. GRICHUK, V. P., and R. V. FEDOROVA. K voprosu o kharakteristike prilednikovof rastiteľ nosti chetvertichnogo perioda na severe Aziatskogo materika. (Akademiñ nauk SSSR. Izvestiñ, seriñ geograficheskañ, Mar.—Apr. 1956, no. 2, p. 66–71, table.) 11 refs. Text in Russian. Title tr.: Quaternary periglacial vegetation in the North of Asiatic continent.

Ground samples were collected by E. S. Korotkevich a few years ago on the northwest coast of Kotel'nyy Island, from surface soil and at various depths to 1.20 m., the deepest from fossil ice. B. N. Gorodkov handed them to the Geographical Institute of the Academy of Sciences for analysis. Pollen and spore counts are tabulated in comparison with similar data from central Yakutia and other regions. Three layers of ground are distinguished by characteristic

pollen composition. Conclusion is offered that forests were not present in the Quaternary periglacial vegetation of this region. Presence of plant tissues in the fossil ice is attributed to accumulation of firn in relief depressions.

45291. GRICHUK, V. P. Rastitel'nost' russkoI ravniny v nizhne- i srednechetvertichnoe vremîa. (Akademiâ nauk SSSR. Institut geografii. Trudy, 1950, vpp. 46, Materialy po geomorfologii i paleogeografii SSSR; raboty po sporopyl'fsevomu analizu, 3, p. 5–202, diagrs., tables, maps.) 96 refs. Text in Russian. Title tr.: Vegetation of the Russian Plain in the Lower and Middle Quaternary.

Summarizes results of paleobotanical investigations based chiefly on pollen analysis. Vegetation of the Russian Plain, including its arctic regions, is characterized for four geological epochs: end of the Pliocene and beginning of the Quaternary, climatic optimum of the Likhvin-Dnepr interglacial epoch, maximum glaciation, and climatic optimum of the Dnepr-Valday interglacial epoch. The paleogeographic distribution of various plants and their associations is discussed and mapped schematically; comparison is made with the present-day vegetation. Present-day dissemination of pollen was investigated by the Institute of Geography's Laboratory for Spore-Pollen Analysis at various stations, including one on the Andega River in Malozemel'skaya Tundra and another on the Shuga River at Ob' Bay; results are reported (p. 20-23).

**45292. GRIEM, SYLVIA F.,** and **S. ROTHMAN.** Cutaneous sensitivity to cold. (American practitioner and digest of treatment, Aug. 1956. v. 7, no. 8, p. 1335–41.) 74 refs.

A review of the field, based largely on literature, especially that since 1924 when the concept of "physical allergy" was propounded. Cryoglobulinemia, paroxysmal (luetic) cold hemoglobinuria, cold hemagglutination and cold urticaria are discussed, specifically: first reports, incidence, symptoms and diagnosis, etiology, therapy, information from experiments, etc. Possible common cause "passive transfer" and its interpretation, etc., are also considered.

Copy seen: DNLM.

45293. GRIFFIN, DONALD RED-FIELD, 1915—, and others. The comparative physiology of thermal insulation. Ladd Air Force Base, Alaska. Aug. 1956. 60 p. illus., tables (U. S. Air Force. Arctic Aeromedical Laboratory. Project no. 8-7951. Report no. 6.) 11 refs. Other authors: H. T. Hammel and K. S. Rawson.

A comprehensive study dealing, in pt. 1 (p. 1-29), with heat transfer through the skin and fur of living animals; this includes investigations on heat loss in red-backed voles, temperature gradients through the fur of Alaskan mammals in the winter and heat flow through the skin. Pt. 2 (p. 29-57) describes measurements of thermal conductivity and insulation value of various animal pelts in the fresh, dried or tanned state; some fur substitutes are also included in these determinations. A number of experiments were made in improving fur insulation by replacing the air in and around it by other gases.) Copy seen: DNLM.

**45294. GRIFFITH, J. W.** A bibliography on the occurrence of uranium in Canada and related subjects. Ottawa, Queen's Printer, 1956. 111, 34 p. (Canada. Geological Survey. Paper 56-6.)

Approx. 475 references mostly to Canadian publications, but including a few foreign papers that refer at length to Canadian deposits. Newspaper articles are excluded, and only such geological maps and reports are included as result from projects undertaken specifically because of uranium. References are grouped as general publications; those referring to individual provinces, including the Northwest Territories; works on particular subjects, as age determination, exploration, mineralogy, prospecting, etc. This third category includes several publications on northern Canada.

45295. GRIFFITH, M. V. The thermal properties of frozen soil. (International Institute of Refrigeration. Bulletin (Supplement: Proceedings of meetings held at Grenoble, France, Sept. 24–25, 1954.) Annexe 1955–2, p. 147–53, tables.) Summary in French.

"Results of several earlier investigations on heat transfer and moisture migration in soils are reviewed, and some preliminary data are reported from laboratory studies in England on heat transfer to heat pump coils from different soil types. The measured values of thermal conductivity in soils surrounding chilled

pipes are considerably higher than the accepted values for the soils, a fact attributable to moisture migration toward the cold area. With freezing of the soil, the apparent conductivity of a representative soil rises to .0064-.0091 gm. cal./sec. sq. cm. ° C. The specific heat of clay soil at -6.6 ° C. near a cooling coil was 0.19 as compared with 0.23 for the same soil (dry) at 15.5 ° C. Diffusivity for a sample of the same soil at a moisture content of 32.6 percent was .0045 cc./sec. measured of a temperature range of -9.5 ° to -32.2 ° C."—SIPRE.

45296. GRIFFITHS, THOMAS M. Glacial geomorphology on the Mt. Mc-Kinley massif, Alaska. (In: International Geographical Union. Eighth General Assembly and Seventeenth International Congress, Washington, D. C., Aug. 8–15, 1952. Proceedings, pub. 1956? p. 331–36, 2 illus., text map, cross-sections.) Refs.

The geology, structure and orogenic history of the massif are summarized: also climate and weather conditions. with emphasis on storm tracks and precipitation pattern. The massif displays two erosion zones, demarcated at approx. 16,500 ft. and this pattern is directly related to present storm levels. Maximum erosion takes place below that level. the highest of precipitation for frontal storms (major cirque headwalls reach about 16,000 ft. maximum). Above that level, weathering and erosion are modified and retarded by very low temperatures, low precipitation and thus small accumulation of snow and firn. Steep sides below 16,500 ft. give way to much gentler slopes above. Storm paths have also played an important part in rate and direction of mass retreat in the massif. Copy seen: DGS.

45297. GRIGGS, ROBERT FISKE, 1881– . Return of animal life to the Katmai district, Alaska. (Entomological news, Feb. 1917, v. 28, no. 2, p. 70.)

Notes that predacious animals, both mammals and insects, are returning before herbivorous types. The area near the volcano was practically devoid of insect life three years after the eruption (1915) but was fairly swarming in 1916. Most of these were predacious, parasitic or coprophilous. Study of the revegetation of the Katmai district was sponsored by the National Geographic Society.

45303. GRIP, ERLAND. Den autoktona sedimentserien vid Laisvall. (Geologiska föreningen, Stockholm. Förhandlingar, 1950. bd. 72, häfte 3, no. 462, p. 369–71). Text in Swedish. *Title* tr.: The autochthonous sediment series at Laisvall.

Between the eastern border of the Swedish mountains and the Norwegian border in the Laisvall (66°06' N. 17°09' E.) region, the pre-Cambrian Sorsele granite passes into weathered breccia and then into arkose. Vertical and horizontal jointing, visible in the granite, have led to the weathering. In the arkose are fragments of granite which decrease upward in number and size. Chemical composition of the material also changes with increased transformation from granite to arkose. Over the arkose is a tillite-like conglomerate which the author believes to have been icemoved. In the series above this are some beds allied to those described by other writers on the region. Mineral occurrences are related to the geologic series. Copy seen: DGS.

45304. GRIP, ERLAND. Blymalmen vid Laisvall, dess geologi och en jämförelse med några utlandske förekomster. (Geologiska föreningen, Stockholm. Förhandlingar, 1954. bd. 76, häfte 3, no. 478, p. 357–80, 2 diagrs., 3 illus., text map) 15 refs. Text in Swedish. Summary in English. *Title tr.*: The lead ore at Laisvall, its geology and a comparison with some foreign deposits.

Geology in the arctic section of Sweden is closely allied with that immediately to the south. In Laisvall, where the lead deposit under consideration is found about 10 km, south of the Arctic Circle. the rocks involved are eo-Cambrian overlying Cambrian shales, the mineralization being related to zones of weakness and to quartzitic rocks. Local geology includes the peneplaned pre-Cambrian bedrock, deeply weathered. Several ridges above the peneplane level, which were above the level of the eo-Cambrian sea. are said to account for sedimentary differentiation, presently ranging from slate to conglomerate. The sequence of sedimentary series is explained, with reference to tectonic activity and ore deposition. The lead deposit is compared to similar occurrences in Germany, eastern Morocco, Wales, the northern Pennines of England and the Tri-state district of the United States.

45314. GROSS, W. H. The direction of flow of mineralizing solutions, Blyklippen mine, Greenland. (Economic geology, Aug. 1956. v. 51, no. 5, p. 415-25, 8 text maps.) 23 refs.

The lead-zinc orebody at Mesters Vig, northeast Greenland (72°09' N. 23°45' W.), is used to illustrate the application of flow techniques to a mine problem. At Blyklippen, relatively flat-lying sediments are downfaulted into a fairly simple graben structure. Faults are normal and generally filled with banded to crystalline Many places along main fault quartz. zones contain galena, sphalerite, and small amounts of chalcopyrite. Four methods for determining flow direction are described: structure, growth banding and asymmetry in quartz crystals, mineral zoning, and quartz decrepitation temperatures. Recent work at Blyklippen indicates that knowledge of flow direction is helpful as a guide in search for ore, although other factors must also be considered. Copy seen: DGS.

45320. GRUNDSTEDT, HENRY G. Hydroelectric power keeps NYAC gold placer on a paying basis. (Mining world, June 1956. v. 18, no. 7, p. 48-51, 7 illus., text map, table.)

Describes operations of New York Alaska Gold Dredging Corp. (NYAC), 65 mi. east of Bethel (60°48' N. 161°45' W.) in the Kuskokwim River basin, the only such company in Alaska to use hydroelectric power. Its camp (pop. approx. 100 in summer), modern facilities, radio station, and daily air service are noted. Supply problems are described; also the hydroelectric plant, maintenance of equipment, mining operations, exploration program, moving dredges to new sites.

Copy seen: DGS.

45321. GRUNDSTEDT, HENRY G. Sound planning and hard work make this Alaskan placer pay. (Mining world, May 1956. v. 18, no. 6, p. 53-55, 5 illus., port.)

Describes the Miscovich gold placer operation in the Poorman district (64°05′ N. 155°35′ W.), 66 mi. south of Ruby. Bulk freight is hauled in on sleds during winter. Operating conditions, determination of reserves, mining procedures, desliming operation, recovery plant are sketched.

Copy seen: DGS.

45322. GRUNIN, K. Â. Nasekomye dvukrylye, t. 17, vyp. 1; zheludochnye ovody (Gastrophilidae). Moskva-Leningrad, Izd-vo Akad. nauk SSSR, 1955. 95 p., 107 illus. (In: Fauna SSSR. Insecta Diptera, t. 17, vyp. 1 (nov. ser. no. 60).) 141 refs. Text in Russian. Title tr.: Dipterous insects; the botflies

(Gastrophilidae). Contains a systematic index of the species, and (in introductory part, p. 7-38) data on external structure, anatomy, physiology, biology, and geographic distribution: Africa, Asia, also a few cosmopolitan species living on domestic animals. Hosts are chiefly horses, mules and donkeys; damage done by the botflies as animal pests, methods of control and prophylaxis are presented. Systematic position of the family is shown. In the special part (p. 39-95) is a diagnosis of the family, keys to imagines, eggs and larvae of second and and third stages; seven species and six varieties (imagines and larvae) described with data on metamorphosis, biology, hosts and methods of control prophylaxis. Gastrophilus testinalis, a parasite of the horse and donkey, occurs in Yakut A. S. S. R. Copy seen: DLC.

Special preparation of ice roads for hauling logs is described in detail. The road is scraped of snow and watered for icing. The logs are loaded on a few platforms mounted on sleds and connected by a loose chain with the automotive truck. The truck e has is operated by gas generated from young cuttings. The truck is heavily loaded with a ballast to increase traction of the rubber tires. The loose chains allow the train to start gradually one platform after another.

45324. GRUZDEV, N. I. Tanki; teorifa. Moskva, Gos. izd-vo mashinostroitel'noI lit-ry, 1944. 482 p., tables, illus. graphs, diagrs. 36 refs. Text in Russian. Title tr.: Tanks; theory.

Textbook approved for the Military Academy and technical schools.

Presents theoretical and practical aspects of design and operation of self-propelled tanks. Formulas, graphs and tables are included for computation of load distribution stresses, and ice thickness required for tank traverse. Winter obstacles are dealt with, as snow embankments (p. 434) and frozen waterways, marshlands, and deep snow fields (p. 439-43.)

A free translation of a part of this book was pub. as: Tank performance in snow and mud (Land locomotion Research Laboratory. Research report, 1955. v 1, issue no. 2, p. 23–25, diagrs., tables) Copy in DLC. In it a number of parameters affecting tank performance are discussed. Tanks may sink and become immobilized if mud or snow depth exceeds ground clearance. Successful operation requires ground pressures below 4.2–5.6 psi. Critical snow thicknesses for various tanks are tabulated. Copy seen: DLC.

45325. GRYC, GEORGE, 1919—, and others. Mesozoic sequence in Colville River region, northern Alaska. (American Association of Petroleum Geologists. Bulletin, Feb. 1956. v. 40, no. 2, p. 209–254, 3 text maps, tables.) 8 refs. Other authors: W. W. Patton, Jr., F. M. Robinson, F. P. Rucker, H. R. Bergquist, R. L. Detterman, and C. L. Whittington.

Contains stratigraphic information obtained in the region 69°-71° N., 152°-160° W. during 1944-1953 by the U.S. Geological Survey in cooperation with the U.S. Navy's petroleum exploration

program in Naval Petroleum Reserve No. Changes, revisions, and new stratigraphic nomenclature since that pub. in Arctic Bibliography, No. 22268 and 31213 are summarized by Gryc, then discussed by others, viz.: The Tiglukpuk formation of Jurassic age and the Early Cretaceous Fortress Mountain and Torok formations, by W. W. Patton, Jr. (p. 213-23); Early Cretaceous Oumalik Topagoruk formations, by F. M. Robinson, F. P. Rucker, and H. R. Bergquist (p. 223-33); the Early to early Late Cretaceous Nanushuk group and its four formations, by R. L. Detterman (p. 233-44); revised stratigraphic nomenclature of the Late Cretaceous Colville group, by C. L. Whittington (p. 244-53); new Aiyiyak member of the Seabee formation, Colville group, by R. L. Detterman (p. 253-54). Copy seen: DGS.

GUBANOV, N. M., see also Ryzhikov, K. M., and others. K biologii Mosgovoyia pectinata . . . 1956. No. 47725. GUBANOV, N. M., see also Ryzhikov, K. M., and others. Rasshifrovka biologicheskogo fsikla protostrongilûsov... 1956. No. 47726.

45328. GUDGER, EUGENE WILLIS, 1866 - A totally ambicolorate flounder, Platichthys stellatus, from Alaskan waters. (Copeia, Mar. 25, 1941, no. 1, p. 28–30.) 5 refs.

Contains a description and discussion of a "true ambicolorate flounder, being as dark on the left or lower side as it is on the right or upper side." This abnormal specimen had been caught 15-20 miles off Petersburg, Southeast Alaska.

Copy seen: DLC.

45329. GUDKOVICH, ZALMAN MAR-KOVICH. Depth soundings. Washington, D. C., 1956. 3 p. tables. (*In:* Somov, M. M. Observational data . . . drifting station 1950–1951, pt. 1; translated by E. R. Hope.)

Results from drifting station North Pole-2 in the Arctic Basin, 76°02' N. 193°33′ E. - 81°49′ N. 195°31′ E., Mar. 30, 1950-Apr. 11, 1951. soundings were made with a motordriven winch, and additional depth measurements were made in the course of taking bottom samples and other special studies. The drift path was such that the resulting measurements more clearly defined the submarine peninsula to the north of the Chukchi Sea, also the boundaries and structure of the continental slope. The coordinates and depth determinations are tabulated for approximately 285 measurements.

Copy seen: CaMAI.

45330. GUDKOVICH, ZALMAN MARKOVICH. Results of a preliminary analysis of the deepwater hydrological observations. Washington, D. C., 1956. 7 p. 4 diagrs., tables. (Somov, M. M. Observational data . . . drifting station 1950–1951, pt. 2; translated by David Kraus.) Diagrams and four supplements of tables are paged, from Russian original: 42–170.

The most interesting result of the analysis was the location of a characteristic warm interlayer at 50–100 m. Plankton studies and other considerations indicate that this water enters from the Bering Sea, and has been named Pacific Ocean water. All oceanographic data are tabulated including chemical composition, salinity determinations, and temperature measurements.

Copy seen: CaMAI.

45331. GUDKOVICH, ZALMAN MARKOVICH. Water-temperature observations and collection of samples for chemical analysis. Washington, D. C., 1956. 7 p. 2 illus., map. (In: Somov, M. M. Observational data . . . drifting station 1950–1951, pt. 1; translated by E. R. Hope.)

The observational program, equipment, and procedure are discussed. Observations, carried out at standard horizons, surface-3000 m and layer adjacent to bottom, included temperature, salinity, oxygen content, hydrogen-ion content, and transparency. The positions of the hydrological stations are mapped.

45334. GUL'BINSKAÑ, MARIANNA. V zasnezhennol tundre. (Sovetskañ zhenshchina, Apr. 1956, no. 4, p. 7, illus.) Text in Russian. *Title tr.:* In the snowcovered tundra.

Describes arrival of a projection team in Markovskiy rayon, Kamchatskaya Oblast', and showing of a film "Lenin v Oktabre" to members (Chukchis) of the eight reindeer-breeding brigades of the Zhdanov kolkhoz. Travel difficulties along the roadless tundra in April are noted. Copy seen: DLC.

45335. GULENKO, N. N., and V. E. GORA. Moshchnye snegoochistitel'nye i snegouborochnye mashiny. (Zheleznodorozhnyi transport, Nov. 1956. god 38, no. 11, p. 49-55, table, illus., diagr.) Text in Russian. *Title tr.:* Powerful snowplows and snow-removal machinery.

Snowplows in recent use on Soviet railroads are described, and their performance is discussed. New models to be tested in the winter of 1956-57 are described in detail. Snowplows built by the Central Office of Railroad Machinery can clear snow about 1.5 m. thick at speeds up to 65 km./hr. A new electric rotary snowplow tested on the Orenburg and Kuvbvshev railroads has been designed for removing snowdrifts up to 4.5 m. high. This model has two scrapers for cutting the snow and a rotor which will throw it a distance of about 65 m. Electric power for the motor-generators is supplied by main generators of the diesel locomotive pushing the snowplow. Five machines of this type will be ready before 1957 and another hundred at the end of five years. Snow removal from a station area is usually by smaller machines and plows. Construction of fences and panels and planting of forest belts are stressed as the more permanent measures for snow drift prevention on railways. Copy seen: DLC.

45336. GULÎAEV, IVAN ALEKSAN-DROVICH. Okhota na pushnykh zvereľ. Moskva, Fizkul'tura i sport, 1956. 80 p. illus. Text in Russian. Title tr.: Hunting fur animals.

Popular sketch of the biology, distribution, hunting and trapping of the main fur-bearers of the U. S. S. R., including animals occurring in the far North: squirrel, sable, fox, wolf, arctic fox, bear. Stress is laid on non-commercial hunting, especially with dogs. The main breeds of hunting dogs are characterized (p. 75–80).

45348. GURINA, N. N. Osnovnye ėtapy drevneishei istorii Kol'skogo poluostrova po dannym arkheologii. (Leningrad. Universitet. Uchenye zapiski, no. 115, 1950. Fakul'tet narodov Severa, vyp. 1, p. 38–56, illus.) Ref. Text in Russian. Title tr.: Basic stages of ancient history of Kola Peninsula according to

archeological data.

Based on the 1928 investigations of A. V. Shmidt, q. v., and expeditions of the Institute of the History of Material Culture of 1935-37, and 1946-47. Four basic stages of culture and their geographical distribution are outlined; arctic paleolithic, arctic eneolithic (late neolithic), early and late metal ages. late neolithic stone labyrinths peculiar to Kola Peninsula and southern White Sea coast, southern Finland and some regions of Sweden and Norway are discussed; their use as fish traps is suggested, The settling of Kola Peninsula from northeastern Karelia and similarities and influences between contemporary cultures of Norway, to the west, and as far east as Yakutia seem apparent from the 1947 excavations. This paper was presented at the Northern Conference at Leningrad University, Dec. 10-14, 1947.

Copy seen: DLC.

45349. GURVICH, I. S. Éveny-trûgsasiry. (Akademiß nauk SSSR. Institut étnografii. Kratkie soobshcheniß, 1956. no. 25, p. 42-55, illus., map.) 6 refs. Text in Russian. *Title tr.:* The Éveny-Trûgssiry.

Account of the history and present conditions among the Tiûgâsir tribe of the Lamuts (a branch of the Tungus) inhabiting the region in Yakutia east from the Lena to the Omoloy River and from the Malyy Sakkyryr to Guba Buorkhaya of the Laptev seacoast (approx. 67°-72° N. 123°-130° E.). The origin and mythology of this people, their migration and movements, tribal subdivision, contacts with Yukaghirs.

Yakuts and others, are outlined. They are reindeer herders, who carry on hunting Their food, housing, and fishing also. and clothing are described. Marriage (exogamy), magic and burial rites are discussed. Population data are given (from No. 13159 of Arctic Bibliography) for 1897, when they numbered altogether 447. Administration of the Trugasir in the post-Revolutionary period is outlined. also their transition from a nomadic to a sedentary way of life: two, mainly reindeer-breeding, kolkhozes have been developed (which seem to comprise all or most Tiugiasir) and census-type data are given.

Title tr.: The changes in the culture and customs of the population of the far North of Yakutia under the influence of Russian culture.

Describes the geographic distribution and migration routes of the peoples inhabiting northern Yakutia (Tungus, Lamuts, Yukaghirs and Chukchis), their customs, cultural level and basic economy in the 17th century, and the enanges resulting through close contact with Russian settlers. The industrial, economic, educational and medical advances under the Soviets, the introduction of collectivization, creation of kolkhozes, etc., are discussed. Copy seen: DLC.

45351. GUSAKOV, S. F., and A. S. VAĬOGANT. Proizvodstvo zemliānykh rabot v zimnee vremiā (Stroitel'naiā promyshlennost', Sept. 1956, god 34, no. 9, p. 7–10, illus., table, diagrs.) Text in Russian. *Title tr.:* Ground excavation in winter.

Methods and equipment for excavation of frozen ground are described in detail. A special electrically driven drill stand and Diesel-engine driven crane with crusher weight are used for preliminary breaking of the ground, and steam boiler equipment for thawing large surfaces. This equipment is used in laying of water and sewer pipes and in road construction (with prefabricated reinforced concrete plates or surface of fresh frost resisting reinforced concrete made of slag-Portland cement and a The work was chlorous ingredient). carried out successfully at air temperature -15° C. A 30-day concrete sample showed strength up to 179 kg./ cm2, and a 60-day sample to 243 kg./ cm2, i. e. about 100 percent specified strength. Copy seen: DLC.

45353. GUTKOVA, N. N. Mineralogicheskafa s'emka Kitchepakhka. (In: Khibinskie apatity, 1933. t. 6, p. 197–99.) Text in Russian. Title tr.: A mineralogical survey of the Kitchepakhk.

Describes the southwestern part of the Khibiny tundras, composed mainly of normal and trachytoid khibinite, metamorphic strata and partially of other rocks; this survey, supplementing that of central Khibiny, indicates the absence of deposits of industrial value.

Copy seen: DGS.

45354. GUTKOVA, N. N. Mineralogifa llkspora po rabotam 1931–1932. (In: Fersman, A. E. Za polfarnym krugom, 1932. p. 27–37, illus., table, map.) Text in Russian Title tr.: The mineralogy of Yukspor according to investigations in 1931–1932.

Outlines classification of deposits in the zone of micaceous nepheline syenites of Yukspor Mountain, based on mineralogical surveying done by the Scientific Institute of Fertilizers (Nauchnyl institut udobrenil, NIU) and by the Academy of Sciences' Kola Peninsula Expedition in 1931–32. Six types of deposits are distinguished: aegirite-feldspathic, astrophylite, natrolite, yuksporite-pectolite, nepheline-feldspathic and apatite. Data on mineral distribution in various zones of the deposits are summarized in a table. Text map, 1:100,000.

A review covering advances in this field since about 1950. It deals specifically with the effects of hypothermia upon the adrenal, thyroid, hypophysis and other endocrines; participation of the individual glands in temperature regulation. Both the physiological and morphological aspects of the problems are discussed.

"The application of selected concepts of pedology to highway soil-engineering problems is discussed. Soil samples were taken from selected horizons of 19 soil types in glaciated areas of Wisconsin. Each profile was assigned a generalized frost-susceptibility rating based on the rating of each of its horizons. A comparison of these ratings with the drainage index shows that the soils least susceptible to frost action usually occupy the better drained positions; soils most susceptible to frost action are in the intermediate to poorly drained positions. Observations of pavement performance over several types of soil showed that there is a good correlation between the drainage index and actual pavement performance as measured by the intensity of pavement cracking, resurfacing requirements, and by the observable changes over a period of 10 yr."-SIPRE. 45367. HAEFELI, ROBERT, 1898and F. BRENTANI. Observations in a cold ice cap. (Journal of glaciology, Oct. 1955, v. 2, no. 18, p. 571-81; Mar. 1956, v. 2, no. 19, p. 623-30, 2 illus., text map, diagrs.) 24 refs.

The first part of this paper deals with investigations of morphological relationships and measurements of movement and deformation on the Jungfraujoch,

Switzerland. In the second part, "the relations between stress, movement, temperature, and viscosity conditions in coldice are discussed, with particular application to conditions of the Jungfraujoch. Some theoretical relations concerning the movement of icecaps with plane deformation are given, with special reference to central Greenland. Brief comparisons are made between conditions in Greenland and for alpine glaciers, and the importance of temperate glacier studies as a connecting link between arctic exploration and laboratory studies is suggested."—SIPRE.

45376. HAGEN, INGVAR. The irruption of hawk-owls, *Surnia ulula* (L.), in Fennoscandia 1950-51, with some re-

marks on recent micro-rodent cycles. Stavanger, 1956. 22 p., 3 diagrs., 3 text maps. (Stavanger Museet. Sterna, no. 24.) 27 refs.

Discusses the great number of hawkowls in autumn and winter 1950-51, observed mostly in the central and southern sections of Sweden and Finland. The author disputes the opinion of some Scandinavian ornithologists that the owls came perhaps from northern Russia and Siberia because of the low reproduction of lemmings and voles since 1942. Recent micro-rodent cycles (L. lemmus, Microtus agrestis, M. oeconomus, Clethrionomys glareolus and C. rufocanus), are reviewed; also rodent frequency and owl reproduction. Conclusion is offered that the rodent population in northern localities decreased in 1950-51 and thousands of hawk-owls were forced to evacuate these districts moving towards central and southern parts of Sweden and Finland. Copy seen: DLC.

45377. HAGEN, PEDER. Litt om reindriften i Nordland. (Sameliv; Samisk selskaps årbok 1951–1952. p. 83–86.) Text in Norwegian. Title tr.: Short notes on reindeer husbandry in Nordland.

Until about 1800, and in some districts till the second world war, reindeer in Nordland (approx. 65°-68°40′ N. 14° E., north Norway) moved into Sweden for winter pastures; but nowadays most of the reindeer husbandry is more local in character. There are about 100 reindeerherding families in the district, who own about 16,000 animals. Another 10,000 could be maintained, it is estimated, as grass pastures are good.

Orchids north of the Arctic Circle in Scandinavia may be either autogamous or endogamous. The mechanism of self-fertilization of Chamaeorchis alpina is described and illustrated. Specimens of this species from Norway and northern Sweden were embedded in paraffin and studied microscopically in thin sections.

Copy seen: DLC.

45379. HAGGERTY, JAMES J., Jr. Subways under the icecap. (Collier's,

May 11, 1956. v. 137, no. 10, p. 88-93.

7 col. illus., text map, diagr.)

Popular account of U.S. Army research in tunnel building under the Greenland inland ice in the Thule region. Construction of a trans-Greenland subway for electric trains with under-ice way stations appears feasible. Subway from Thule northeast to Pearv Land would provide means of supplying air bases and missile launching sites about 500 mi. nearer the Pole where supply by sea is impossible. Author visited tunnels at one of the two permanent installations on the icecap and at Camp Tuto (Thule take-off) 14 mi, southeast of Thule, Construction of snow-compacted runway is also described. Copu seen: DLC.

45380. HAGLUND, BERTIL, Editor. Den levande skogen; handbok för skogsvandrare. Stockholm, Norstedt, 1955? 208 p., illus. Text in Swedish. tr.: The living forest; handbook for forest wanderers.

Papers (11) by the editor, R. Ivarsson and E. Sillerström, well illustrated with photographs and drawings. Tree species of the Swedish forest are identified and described in turn. Associated vegetation, forest climate, soils, mycorrhiza, animals, birds, also tree diseases and pests are discussed, with references throughout to the far North.

Copy seen: DLC.

45381. HAGLUND, DONN KEITH, 1926- . Recent economic developments in the Godthaab District, Greenland. (Association of American Geographers. Annals, June 1956. v. 46, no. 2,

p. 248-49.)

Abstract of paper presented at the 52nd Annual Meeting of the Association, Montreal, Apr. 1-5, 1956. Godthaab (64°11′ N. 51°43′ W., pop. 2,300) has been the administrative focus for all Greenland since 1947; in 1954 it became the health center. The Greenland Provincial Council has convened there each Aug. since 1953. Housing and other construction, radio, press, and private business grow in the town, also, more slowly, in outlying settlements. Reindeer and sheep herding experiments have been successful. The distribution of marten (Martes americana) and fisher (M. pennanti) as known at present is reviewed: the data presented by states, provinces and territories (text maps), include Alaska, northern Manitoba, Northwest Territories, northern Quebec, Labrador, and Yukon Territory. Copy seen: DA.

45383. HAHN, P. Effect of environmental temperatures on the development of thermoregulatory mechanisms in infant rats. (Nature, July 1956, v. 178, no. 4524, p. 96-97, table.) 9 refs.

Account of experiments designed to counteract, by short exposures to cold. the inhibitory effect of high environmental temperature upon development of thermoregulation. The results indicate that thermoregulatory reactions to cold develop post-natally in close dependence on environmental temperature. Copy seen: DNLM.

45384. HAHN, P., and others. Vývoj thermoregulace, 1; k otazce vývoje thermoregulačních mechanismů krysího mláděte. (Československá fysiologie, 1956. ročník 5, sešit 3, p. 295-301, illus., table.) 13 refs. Text in Czech. Other authors: Title tr.: J. Křeček and J. Křečková. Development of thermoregulation, 1; on the problem of development of thermoregulatory mechanisms in young rats.

Account of investigations of the problem at ambient temperatures of 29.5° and 10° C. In the cold environment, rectal temperature fell quicker in 14-dayold than in 18-day-old animals, and reached 15° C. In maintaining identical body temperature at the same ambient temperature, young animals used up more oxygen than old ones. The probable cause of this difference is discussed.

Copy seen: DNLM.

45385. HAHN, P. Vývoj thermoregulace, 2; o účasti štítné žlazy při vývoji thermoregulace u krys. (Československá fysiologie, 1956. ročník 5, sešit 3, p. 302-307, illus., table.) 17 refs. Text in Czech. Title tr.: Development of thermoregulation, 2; role of thyroid gland in the development of thermoregulation in rats.

Report of investigation on the effects of medium (29° C.) and low (10° C.) temperature upon rats thyroidectomized 4-5 days after birth. At the age of 18 days, fall of rectal temperature due to cold, was greater than in controls, but smaller than in 14-day olds; 0<sub>2</sub>-requirement in the cold was, for a given rectal temperature, lower than in non-operated controls. In the warm environment rectal temperature was also lower than that of normal controls.

HALL, EUGENE RAYMOND, 1902–, see Bee, J. W., and E. R. Hall. Mammals . . . northern Alaska . . . 1956. No. 43919.

**45390. HALL, HENRY S.,** Jr. A geologist in the Arctic. (American alpine journal, 1956; v. 10, no. 1, issue 30, p. 136–38).

Contains excerpt from letter to Hall by geologist E. F. Roots, describing Operation Franklin, Canadian Geological Survev mapping project in the Queen Elizabeth Islands, summer 1955. Roots and others spent May and June establishing main camps and fuel caches using ski-DC-3 aircraft and dog teams; dog-sledging trips were also made to determine basic stratigraphy on Ellesmere, Ellef Ringnes, Melville, and Somerset Islands. two-man field teams were distributed by helicopters at pre-selected points in June, and work was carried out by foot traverses, camp moves by helicopter. Poor visibility kept parties grounded more than a third of the time. Interesting topographic and geologic features of Axel Heiberg are briefly described.

**45392. HALL, JOHN L.** A pre-logging salmon stream study. (*In*: Alaskan Science Conference . . . 1953. Proceedings.

pub. 1956, p. 105-106.)

Abstract of report on the Alaska Forest Research Center study (from 1949) to determine effects of logging on salmon streams. Four water sheds typical of those on the Ketchikan Pulp Allotment were selected on Prince of Wales Island, Southeast Alaska (55°40′ N. 133° W.), two to be logged, two used as controls. Weather and water height records are collected, yearly mapping program carried out to note physical changes, and fish are trapped. Results will be studied.

(Norske videnskaps-akademi, Oslo. Matematisk - naturvidenskapelig klasse. Avhandlinger, 1955, no. 1.) 35 refs.

Contains notes on materials, methods and terminology, followed by a list of 27 species of cocoolithophorids classified or characterized in the light microscope and observed in the electron microscope. A great variety in the shape and microstructure of the coccoliths is demonstrated. Nine species are described as new. A part of material used in the study was collected by weather ship M in Norwegian Sea at 66° N. 02° E. A list of coccolithophorids, arranged according to the structure of their coccoliths, is appended.

45397. HALLOCK, H. R. Troop operations in the North. (Military engineer, May-June 1956. v. 48, no. 323, p. 214–17, illus., map.)

Steps taken early in 1947 to develop a program for maintenance and repair of certain U. S. military bases and weather stations located in northeastern Canada and southwest Greenland are described. The installations had been made in World War II, but, their use curtailed, the facilities deteriorated. An engineer survey crew made a two-month study of

six air bases. Much of the equipment was well preserved, due largely to the dry climate. Combined military units were formed in Mar. 1947 to perform the rehabilitation work. Logistic support proved to be the major problem. The need for advanced planning and the advantages of troop labor in operations of this kind are stressed.

Describes the seven slaughter-houses for reindeer built in Norway since 1949. They are essential both to facilitate work for the Lapps and to guarantee high-quality meat for the public. Regulations for slaughter of domestic animals and of reindeer are discussed.

Copy seen: DLC.

45399. HAMBERG, AXEL, 1863–1933. Bau von Hütten im Sarekgebirge. Stockholm, Centraltryckeriet, 1926. 46 p. illus., diagrs. (1 fold.), map, tables. (His: Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 1, Abt. 1, Historik und Topographie, Lfg. 1). Text in German. Title tr.: Building of huts in the Sarek Mountains.

Contains a detailed account of the author's hut construction activities during his expeditions into the Sarek Mountains since 1895. Construction procedures and features of various types of shelters and huts used for research stations, observatories, and storage units are given with diagrams showing the framework and numerous photographs. The earlier huts were simple wooden structures and those near Pårek were former Lapp dwellings which consisted of alternate layers of birch trunks, birch bark, and light surface peat. Subsequent huts at Pårtetjåkko, Pårek, Litnok, Tjågnons, and Skårkas (the last four are located in the Rapadalen) were constructed of sheet iron (plates 60 x 180 cm.) nailed to both sides of the wooden frame. The intermediate space was filled with cotton. Transportation difficulties were a prime consideration in preference of sheet iron to stone or wood. The thermal properties of the Sarek huts are discussed and compared with huts of other construction types. Transportation methods of supplies are outlined and the effect of ice deposits from fog on huts located at higher altitudes is described.

45401. HAMBERG, AXEL, 1863–1933. Die Eigenschaften der Schneedecke in den lappländischen Gebirgen. Stockholm, Centraltryckeriet, 1907. 68 p. illus., tables, map, diagrs. (His: Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 1, Abt. 3, Gletscherkunde, Lfg. 1.) 63 refs. Text in German. Title tr.: Properties of the snow cover in the mountains of Lapland.

"Various properties of the winter- and summer-snow zones, and of the rime and hoar zone of the summits are discussed. Included are melt phenomena and snowsurface modifications, snow dunes and ripples, snow retention in coniferous areas, snow line, melt-phenomena due to direct solar radiation and wind, avalanches and glaciers. Snow zones in other parts of the world are analyzed. Chemically effective radiation as well as heat radiation penetrate the snow causing internal melting of the snow on dark objects near the snow surface. Warm winds transform a smooth snow surface into a rippled one due to the melting process. Many of the glaciers are alimented by rime and hoar avalanches."-SIPRE. Copy seen: DGS.

in German. Title tr.: Determination of the influence of the terrestrial horizon

on sunshine durations

Determinations of the terrestrial horizon with the use of a photogrammetric camera at the Pårtetjåkko Observatory are described. The importance of knowing the course of the terrestrial horizon in relation to the astronomical horizon in determinations of the maximum sunshine duration at high latitudes is emphasized. Sunshine duration values for different sun declinations, and a comparison between calculated and the graphically determined influence of the terrestrial horizon on sunshine duration at various declinations are given. Two panoramic plates showing the apparent solar paths at the station are appended.

Text in German. Title tr.: Natural history investigations of the Sarek Mountains in Swedish Lapland under direction of Dr. Axel Hamberg.

Results of comprehensive field studies carried out from 1895 to 1931 by a group of Scandinavian naturalists in the Sarek Mts. (approx. 67°-67°35' N. 17°-18°15' E.) in Lule Lappmark, the highest (2.123) m.) in Sweden. Publication was sponsored by the Royal Swedish Academy of Sciences at (mainly) government expense. The published results, 37 papers comprising altogether some three thousand pages, were issued in 26 fascicles numbered consecutively as issued during 1907-1939. These papers as listed below (according to volume and part, not fascicle) with titles translated, are abstracted in this Bibliography under their authors' names. A few results projected as papers in the History and topography, and as tables in the Meteorology volume, have not been published, and are not now planned for publication.

45407. HAMBERG, AXEL, 1863–1933. Struktur und Bewegungsvorgänge im Gletschereise nebst Beiträgen zur Morphologie der arktischen Gletscher. Stockholm, Centraltryckeriet, 1932. p. 69–124, illus., diagrs., tables. (His: Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907–1939. Bd. 1, Abt. 3, Gletscherkunde, Lfg. 2.) 89 refs. Text in German. Title tr.: Structure and movement processes in glacier ice and contributions to the morphology of arctic glaciers.

Previous investigations and theories on the origin of glacier bands and their relation to glacier movement are examined critically in the light of studies at the regenerated Suphella Glacier in Norway in

1905 and other glaciers. The theory on the formation of blue bands as a result of the refreezing of fractures caused by shearing is disputed on the basis of theoretical considerations. Factors determining the plastic behavior of ice and its relation to banding are examined. The origin of blue bands is attributed to exfoliations resulting from plastic deformations during differential movement and the freezing of water in the foliation plane. The orientation of the blue bands in glaciers of different types is described, and its relation to topography is considered. Temperature conditions in the Sarek Mts. of northern Sweden are compared with those in the Alps and Spitsbergen, and their relation to glacier movement is discussed. Copy seen: CaMAI.

).

The survey of Dronning Louises Land (76°46′ N. 24°15′ W.) by F. R. Brooke (p. 203–209), deals with triangulation of this region, its connection to existing triangulation of Dove Bugt on the coast, and determination of the height of Krebs Bjerg in the northwest part of Dronning Louises Land. Travel problems, methods, and equipment are described, and some triangulation data are given.

Geology of the Britannia Sø (lake) area, Dronning Louises Land (77°09' N. 23°50' W.), by J. D. Peacock (p. 210–13), is based on field work by the writer and P. J. Wyllie. Geology is described by

regions and a map is presented.

Construction of a topographic map of northeast Dronning Louises Land (scale 1:50,000) from vertical air photography is described by K. Arnold (p. 213–16). Area to be mapped was about 300 sq. mi. Establishment of ground control, plotting of control, and final assembly of map are dealt with. Actual photography, carried out from an R. A. F. Sunderland flying boat, is described by S. Bowater (p. 216–19).

Seismic investigations on the northern part of the Greenland ice sheet, are described by C. Bull (p. 219-25). One of the main projects of the expedition was determination of thickness of the inland ice in the north half of Greenland as had been done in southern Greenland by Expéditions polaires françaises. Methods and results are described; also, briefly, gravity measurements made across the inland ice from Britannia Lake to Thule on the west coast.

Determination of the altitudes of points on the ice sheet by measurement of atmospheric pressure is dealt with by R. A. Hamilton (p. 225-30). Methods are described in some detail, with discussion of errors. Table gives altitudes of the seismic and gravity stations.

The glacier regime in northeast Greenland is discussed by H. Lister (p. 230–37). Two representative glaciers were observed: Admiralty and Britannia Gletscher; methods and results are described. Study indicates that half the net losses of glaciers are compensated by flow from the inland ice, so that glacier recession

is small; also that snow accumulation in northeast Greenland decreased during last half century but has increased during past ten years.

Discussion (p. 238-40) follows the papers. Copy seen: DGS.

45413. HAMILTON, RICHARD A. The measurement of humidity at Britannia Sø 1952-53. [London], May 1956. 12 p. 2 graphs, 6 tables. Mimeographed. Great Britain. Air Ministry. Meteorological Research Committee. M. R. P.

983.)

Description of method used to determine values of relative humidity, vapor pressure, etc., to be published in meteorological tables for Britannia Sø (77°09' N. 23°36' W., altitude 231 m.), main base of the British North Greenland Expedition to Dronning Louises Land. Annual range of temperature was about -40° C. to 16° C. Difficulties were experienced through lack of an absolute instrument for measuring humidities at low temperatures. Instruments used were a dry- and wet-bulb hygrometer, hair hygrograph, and lithium chloride hygrometer. Use of each is described and results given in tables.

45414. HAMMARÉN, HJALMAR. Norrskensfotogrammetri i Abisko under Februari och Mars 1922. Stockholm, 1930. 17 p. diagrs., tables, 9 plates incl. 1 fold. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, bd. 6, no. 1.) Text in Swedish. Summary in English. Title tr.: Auroral photogrammetry at Abisko from February to March 1922.

An analysis is presented of auroral photographs obtained in northern Sweden. Data on type, location, and height are given together with frequency height curves. Definite maxima at 106 and 100 km. were observed which agrees well with earlier observations made in Norway. The projection of various auroral points on the earth's surface is mapped.

45415. HAMMARSKJÖLD, DAG, 1905- Norr om Sulitälma. (Svenska turistföreningen, Stockholm. Årsskrift, 1951, p. 303-319, illus., text map.) Text in Swedish. *Title tr.:* North of Sulitjelma.

The Sulitjelma mountain mass, 1600-1800 m. high, visible from Sarek or Akka, is more rarely visited than Abisko, Kebnekaise, and others. On the Norwegian side, the slope is steep and ice free. On the Swedish side, Sulitjelma slopes gently south and eastward and is ice-crowned. From it can be seen Vestfiorden and the sawtoothed Lofoten ridge. In its flora, climbing, glaciers, tinds, and vistas, Sulitjelma has interest equal to either Sarek or Kebnekaise.

45418. HANDL. LEO. Praktische Schnee- und Lawinenkunde. Innsbruck. E. Schumacher, 1955. 56 p. illus. Text Title tr.: Snow and avain German.

lanche manual.

The characteristics of snow, avalanche formation and causative factors, and methods of avoiding and controlling avalanches are treated in detail. The various types of snow and ice, snow-cover formation, snow metamorphism and controlling factors, the density and hardness of various snow types, snow creep, and snow drifting and its effects are described. Weather conditions conducive to avalanching and the causes for the rupture of snow are discussed. Various types of avalanches, their behavior, control measures, including snow fences, windbreaks, and nets are described. A glossary of snow and avalanche terms is appended. Copu seen: DLC.

45419. HANDLEY, CARROLL AL-FRED, 1911- , and R. A. SEIBERT. The biochemistry of tissue trauma: muscle protein. Randolph AFB, Texas. Jan. 1956. 8 p. tables (U. S. Air Force. Air University School of Aviation Medicine; report no. 55-89.) 9 refs.

Rabbit muscle, if solidly frozen by 30 min, exposure to -15° C., showed a decrease of total extractable myosine by one half and, in consequence, a fall in ATPase activity and sulphydryl content. The ratios of ATPase activity to milligrams of N, and of moles of sulphydryl to moles of N increased. Muscle of rabbits exposed to  $0^{\circ}$  and  $-5^{\circ}$  C. for 30 min. showed little damage after 24 hrs.

Beaches in some arctic areas afford natural summer transportation routes for wheeled vehicles when tundra is impassable. In Pt. Barrow region, sands have low trafficability due to rounded grains and uniform particle size. They may be stabilized by admixing locally available binder materials, though excavation in permafrost, scarcity of clay minerals, etc. present difficulties. Tests in Iowa laboratories indicate that with optimum amounts of tundra clay and ice-rafted beach gravel, the soaked California Bearing Ratio of the com-

<sup>\*</sup>In previous listings, No. 22394, 24075, 35147, 36514 40239, this writer's work was wrongly attributed to his father.

pacted beach material is increased about ten times. Other binders are being investigated for greater stabilization.

45425. HANSEN, A. T., and others. Measurement of coronary blood flow and cardiac efficiency in hypothermia by use of radioactive krypton 85. (Scandinavian journal of clinical & laboratory investigation, 1956. v. 8, no. 3, p. 182–88, illus., tables.) 20 refs. Other authors: B. F. Haxholdt, E. Husfeldt, N. A. Lassen, O. Munck, H. R. Sørensen, and K. Winkler.

Contains description of the new method and comparisons (satisfactory) with earlier ones using the bubble flow meter or nitrous oxide. Application of the krypton 85 method at two levels of hypothermia in dogs showed no changes from normal in coronary arterio-venous oxygen difference and in cardiac mechanical efficiency. Coronary blood flow, left ventricular 02-consumption, cardiac output and work and total body 02-uptake showed a decrease to one-third at hypothermia of 28° C. and to one-fourth at such of 23.5° C.

45426. HANSEN, BERNARD LYLE, 1916– . Instrumentation of ice-cap stations; preliminary report on Project 13b. Wilmette, Ill., Apr. 1955. 7 p. illus., diagrs. (U. S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. SIPRE Report 23.)

Instrumentation at sites on the Greenland ice-cap, described and diagrammed, was employed in connection with tubularshaped buildings placed on the snow. Copper resistance thermometers were installed to determine the buildings' effect on subsurface temperatures. A recording bench mark was installed to measure the elevation of 60 points periodically and thus determine differential setting. Building deformation is determined by measuring tube diameter at 13 places and by transit measurements. Special pressure cells were designed and installed to measure snow pressures on the tubes. Copy seen: DLC.

Text in Swedish. Summary in English. Title tr.: Did the common shrew "hibernate" on the coast of Norway

during the last ice age?

Contains the results of an investigation carried out by the author, his wife and one companion in summer 1955 on Kvaløya near Hammerfest, and elsewhere in north Norway. The shrew (Sorex araneus, L.) in Scandinavia is considered to be descended from both "hibernating" populations and immigrant populations from the northeast and the south. The species found on Kvaløya, distinct from that on the mainland under identical ecological conditions, is evidence that the shrew "hibernated" in the icefree coastal areas of western and northern Norway. As this mammal has difficulty crossing wide expanses of water, any "hibernating" populations on the islands must survive practically unmixed.

Proceedings of the Eastern Muskeg Research Meeting, February 22, 1956. Ottawa, Oct. 1956. Technical memorandum, no. 42, p. 16–24, illus., diagrs., table.) Ref.

Three methods for assessing shearing strength characteristics of ordinary soils, and problems in testing muskeg, are described. Adapting the vane tester (measures shearing strength of soils in situ) was investigated, and field tests were made near Mile 253 on the Alaska Highway where muskeg is 12-17 ft. thick. Shearing strength increased directly with depth, but maximum strength was developed only after very substantial deformation in the soil. Results showed use of vane tester is feasible, but additional work is required to establish accuracy of tests and evaluate factors such as the fibrous nature of the material.

45439. HARE, FREDERICK KENNETH, 1919—, and R. G. TAYLOR. The position of certain forest boundaries in southern Labrador-Ungava. (Geographical bulletin, 1956. no. 8, p. 51–73, 6 illus., 7 text maps, table.) 11 refs. Summary in French.

Based on program of aerial photographic interpretations of vegetation carried out at McGill University, four physiognomic classes (cover-types) were evolved: close-crown forests, lichen woodland, bog and muskeg, bare rock and scrub. These are discussed for the area approx. 50°-53°30' N. 56°-75° W. and shown on maps, which indicate also proportion of open water (lakes, rivers, etc.) and burned land. The two principal ecological boundaries: the forest/woodland and the inner margin of the "coastal tundra," are determined on the basis of a "purely physiognomic classification of types, a statistical definition, and a wholly quantitative system of representation." The other major boundaries of the peninsula—the northern limits of the woodland zone and of the forest-tundrahave vet to be located.

45447. HARPER, FRANCIS, 1886—. Amphibians and reptiles of the Ungava Peninsula. (Biological Society of Washington. Proceedings, Sept. 12, 1956. v. 69, p. 93–103, 2 illus.) 28 refs.

Contains an annotated list of ten species (three salamanders, one toad, one tree-frog, four true frogs, and one snake) recorded in Hudsonian zone of the region (localities listed, p. 94). Bufo terrestris copei and Rana sylvatica cantabrigensis are treated in detail. Copy seen: DLC.

45448. HARPER, FRANCIS, 1886—. The barren ground caribou of Keewatin. Lawrence, Kansas, 1955. 163 p. 28 illus., text map, tables. (Kansas. University. Museum of Natural History. Miscellaneous publication, no. 6.) Approx, 225 refs.

Contains results of author's investigations in the Nueltin Lake region (60° 20' N. 99°30' W.) in 1947. Spring and fall migrations in the Churchill and Nueltin Lake regions, southern limits of winter range, habitats, trails are discussed, with considerations of the influence of weather, food supply and insects on distribution. Man's use and waste of the caribou are described, also ethnological material from caribou products. Relation of the caribou to other mammals, to birds and flies is examined, and the bad results pointed out of introducing reindeer into the caribou range. Data are offered on numerical status, habits, morphology and taxonomy, with tables of body measurements. Following the comprehensive bibliography, is a chronological list of references briefly annotated on barren ground caribou. A useful index to animals other than caribou, and to plants, institutions, authors, etc., is appended.

Copy seen: DSI.

45449. HARPER, FRANCIS, 1886—. The mammals of Keewatin. Lawrence, Kansas, Oct. 1956. 94 p. 12 illus. on 6 plates, text map. (Kansas. University. Museum of Natural History. Mis-

cellaneous publication, no. 12.) 99 refs.

Contains results of author's field investigations, June-Dec. 1947, in the Nueltin Lake region of southwestern Keewatin (60°20' N. 99°30' W.), work supported by the Arctic Institute of North America. Physiography, vegetation, and comparative abundance of species are briefly discussed. Then follow accounts of 34 species with notes on occurrence, physical appearance, ecology, ectoparasites, food, Thirteen other terrestrial mammals recorded from Keewatin are also listed with locality data and authority for the records. A systematic list of mammalian ectoparasites, with host records, from southwestern Keewatin is given.

Copy seen: DSI.

**45450. HARPER, JOHN B.** Arctic voyage. (Nautical magazine, Mar. 1952. v. 167, p. 163–66.)

Contains a popular account of refueling operations conducted by the British tanker Wave Premier with units of the British Navy off Jan Mayen Island in late Feb. and early March. Some of the incidents resulting from the unfavorable weather are described briefly.

Copy seen: DLC.

45451. HARRER, HEINRICH. Alaska, drei Erstbesteigungen. (Polarforschung, 1954, pub. 1956. Bd. 3, Heft 1–2, Jahrg. 24, p. 281–82.) Text in German. Title tr.: Alaska, three first ascents.

Contains brief descriptions of the conquest of three hitherto unclimbed mountains in Alaska during 1954. Mt. Drum (3,750 m.) was ascended on June 7; Mt. Deborah (4,000 m.) on June 19, and Mt. Hunter (4,680 m.) on July 5. In each case, the author and two companions were flown to a suitable starting point by bushplane.

45457. HARRISON, JAMES MER-RITT, 1915- . Prospecting for iron ore in Canada. (Canadian mining journal, May 1956. v. 77, no. 5, p. 64-66, 3 illus.)

Six main types of iron ore deposits are described, two in subarctic regions; the best of the Lake Superior type deposits are those in Precambrian rocks at Knob Lake, northern Quebec-Labrador. The deposits (goethite and hematite) are trough-shaped, shallow, and in localities of complex structure. The ore has been derived from the enclosing iron formation by some process that removed silica and left iron oxide as a residual enrichment, Colors of weathered ore and appearance of surrounding rocks are described. Prospecting methods are noted. Deposits of the taconite type, low-grade magnetite iron-formation, are known especially from Ungava Peninsula and eastern Hudson Bay (Belcher Islands), but not their commercial possibilities. Copy seen: DGS.

45458. HÁRSING, LÁSZLÓ, and others. Hypothermia hatása az ischaemiás veseelvaltozásokra. (Kiserletes orvostudomány, 1956. évfolyam 8, füzet 1, p. 85–92, tables.) Text in Hungarian. Summaries in Russian and German. Other authors: H. Jellinek, G. Köver, K. László, P. Véghelyi, and S. Fonyódi. Title tr.: Effect of hypothermia on ischemic changes of the kidney.

Closing of the renal aorta in hypothermic dogs for a period of four hours caused only transient azotemia in one out of six dogs and a rise in residual N in one animal; conditions were normal again fourteen days postoperatively. In non-chilled controls, only one out of six survived.

Depocas.

Cold-acclimated rats showed no shivering at  $+6^{\circ}$  C. in contrast to warm-adapted animals; the rise in metabolism in cold-adapted animals, observed after their transfer from 30° to 6° C., is therefore attributed to chemical thermogenesis. During cold acclimatization shivering at  $-6^{\circ}$  C. remained high for at least 5 wks.

45460. HART, JACKSON SANFORD, 1916—, and O. HÉROUX. Utilization of body reserves during exposure of mice to low temperatures. (Canadian journal of biochemistry and physiology, May 1956. v. 34, no. 3, p. 414–21, illus., tables.) 20 refs. Contribution from Division of Applied Biology, National Research Laboratories, Ottawa, issued as N. R. C. No. 3898.

Mice acclimated to 6° C. showed a greater weight and water loss when exposed to freezing temperatures than controls acclimated to 23° C. Fat was the major tissue reserve utilized under these conditions, accounting for 85–89 percent of the total calories, most of the remainder being supplied by protein. There was also a reduction of the heat of combustion of the fat at freezing temperatures, signifying a change in its chemical composition.

The results of investigations during 53 days on the physical characteristics of snow and ice as they affect trafficability on the icecap and in the marginal area at Inglefield Land are reported in detail; data are graphed; ice profiles and maps are presented showing the surface features of the ice margin and suitability of various areas for weasel operations. Measurements on the density, temperature, hardness, and stratigraphy of snow were made in a series of 16 pits varying from 1.49–3.57 m. in depth; 23 rammsonde profiles were taken; and the type of snow, its surface characteristics and

forms were observed. Snow- and icesurface phenomena and the most important feature in each pit are described. The characteristics of various trafficability zones on the icecap and near Inglefield Land are examined individually, and data on the effect of traffic on snow are graphed. The major accomplishment was the discovery of a smooth gentle descent from the icecap to Inglefield Land, the route named Easy Trail. This approach is believed to be suitable for all types of tracked equipment and usable at most times of the year.

45473. HAURWITZ, BERNHARD, 1905— . The geographical distribution of the solar semidiurnal pressure oscillation. New York, N. Y., New York University Press, Dec. 1956. vii, 36 p. diagrs., maps, tables. (New York University. College of Engineering. Meteorological papers, v. 2, no. 5.) 10 refs.

Data from 296 stations, including many in the north and south polar areas, are used to analyze the mean annual surface pressure oscillation. This represents an extension of Simpson's study in 1918 and includes particularly important new data from high northerly latitudes. Mathematical expressions are developed for the migrating and the standing oscillation as functions of longitude and latitude. The amplitude of the migrating oscillation decreases from the equator to the poles where it vanishes. The amplitude of the standing oscillation is considerably smaller and thus dominant only in polar latitudes. Copy seen: DLC.

45474. HAVNØ, EDVARD J. Havhesten, Fulmaris glacialis. (Naturen, Sept. 1926. Årg. 50, nr. 9, p. 287.) Text in Norwegian. Title tr.: The arctic petrel.

In Finnmark, where this observer had never before seen the arctic petrel, he came upon an assemblage of them estimated at 30-50 thousand birds, at Vardø in May.

Contains discussion and tabulation of monthly mean data (1948–1952) for the principal meteorological elements observed aboard weather ships stationed at assumed mean positions of 59½° N. 19½° W. and 53° N. 19½° W. Data are given for wind, pressure, temperature, precipitation and visibility. Diurnal variations of certain of the elements are also discussed. Copy seen: DLC.

45478. HAY, R. F. M. Ice accumulation upon trawlers in northern waters. (Meteorological magazine, Aug. 1956. v. 85, no. 1010, p. 225–29, table.) 5 refs.

Loss of the British trawlers Lorella and Roderigo in Denmark Strait (67°30′ N. 21° W.) on Jan. 26, 1955 due to icing is reviewed. Air and sea temperatures are estimated, and physical processes which might contribute are considered, viz. impact of supercooled droplets of fog, drizzle or rain; accumulation of snowfall; freezing of sea spray. Rates of ice accumulation are calculated. On the Roderigo 50 tons or more accumulated in about 24 hrs. The "icing-up" hazard is increased for a vessel going north in the Denmark Strait and Bjørnøya areas and anywhere near the limit of

ice, as steep horizontal temperature gradients exist (about  $1^{\circ}$  F. each 20 nautical miles). Icing-up from freezing of droplets on impact will be twice as fast at  $21^{\circ}$  F. as at  $24.8^{\circ}$  F.

45482. HEBARD, MORGAN, 1887—. Notes on North American Orthoptera of the arctic-alpine zone. (Entomological news, Jan. 1936. v. 47, no. 1, p. 13–15.)

Contains a general discussion of the response of species to an arctic-alpine environment. The ovoviviparity which occurs in certain arctic butterflies indicates that speeding-up of normal growth occurs even in the egg stage of such insects. In adults, diffusion of the normal color pattern, or darkening, the depauperation, increase in robustness and accentuation of irregularities in contour may well be attributed to the unusually low temperatures. In some cases when a transition from normal to boreal type is confined to a comparatively narrow area, the geographical races should be recognized. Copy seen: DA.

45485. HEDGPETH, JOEL WALKER, 1911- . The Pycnogonida of the western North Atlantic and the Caribbean. (U. S. National Museum. Proceedings, Mar. 8, 1948. v. 97, no. 3216, p. 157–342, illus. 4–53, fold. map, text map.) 133 refs

Contains discussion of classification. zoogeography (tables 1-2) and systematics of sea spiders, keys to the genera and species and a systematic list of about 60 species, with synonyms, descriptions of a new genus and nine new species. measurements, records of localities and stations and data on geographic distribution. Many species native to northern Atlantic and Greenland waters are included. Dredging stations of the Albatross, 1883-87, and of about 50 various North Atlantic and arctic expeditions since 1869 are tabulated, and collected pycnogonids listed (p. 291-335) in appendix. Copy seen: DLC.

45486. HEDGPETH, JOEL WALKER, 1911—. Report on the Pycnogonida collected by the Albatross in Japanese waters in 1900 and 1906. (U. S. National Museum. Proceedings, Mar. 19, 1949. v. 98, no. 3231, p. 223–321, illus. 18–51.) 87 refs.

Contains distributional data including Bering Sea, statistical comments on the Albatross collection of 1906, and the Siboga, 1899–1900; a systematic discussion with keys to the species, synonyms, descriptions of 18 new species, also critical notes and distributional data on about 50 others. Albatross stations, 1900 and 1906 and localities in Siberian waters (Japanese, Okhotsk and Bering Seas) are tabulated in appendix. At least ten species are recorded in Bering Sea and one in Okhotsk Sea.

Copy seen: DLC.

45487. HEDLA, LENORE. Agriculture in Alaska. College, Sept. 1956. 16 p. illus. tables, map. (A joint publication of the Alaska, Dept. of Agriculture, Circular 1, revised, the University of Alaska Agricultural Experimental Station. Bulletin 22, and the U. S. Dept. of Agriculture.) New edition of a text originally pub. in 1917.

Information is presented on the scope and recent growth of Alaskan agriculture; climate; agriculture in the Matanuska-Susitna valleys, Tanana valley, Kenai Peninsula, Southeast Alaska, Kodiak. Pests and diseases, etc., are noted. Functions of agencies serving farmers and settlers are stated.

Copy seen: DA.

45488. HEGNAUER, ALBERT HENRY, 1900—, and B. G. COVINO. Myocardial irritability in experimental immersion hypothermia. (In: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia . . . symposium, Oct. 1955, pub. 1956. p. 327–54, illus. tables.) 33 refs.

A review of studies on dogs. An analysis of conditions and character of hypothermic death is made, and is followed by discussion of ventricular excitability as affected by hypothermia and pH; the latter two as seen in the ECG; arterial and coronary venous electrolyte levels and differences and their role in the events during hypothermia; the effects of calcium infusions on fibrillation. A lengthy discussion following the paper, and covering blood pH during hypothermia and ways of changing it, the effects of circulatory occlusion, of procaine block, etc., is also reported (p. 340-54).

Copy seen: DLC.

45489. HEGNAUER, ALBERT HENRY, 1900-, and B. G. COVINO. Reappraisal of ventricular threshholds in hypothermia. (American journal of physiology, Sept. 1956. v. 186, no. 3, p. 511-12.) 5 refs.

Data presented in the writers' Excitability cycle of the ventricle in hypothermia and Ventricular excitability cycle, its modification by pH and hypothermia (No. 39370, 40318) were obtained by a method now recognized as inadequate. The conclusions based on this work are therefore invalid. As reinvestigated, the threshhold problem shows results only slightly deviating from the normal.

Account of experiments with weanling rats kept at 55° F. and at 78° F. In the first case, magnesium requirements to maintain equal growth were about four times higher than in the control group. The difference in the amount required for

maximum gain was about twofold. High calcium diet was detrimental at low magnesium intake and in some experiments it accentuated cold injury.

Seven new species and four new varieties are described, adding two described species to the faunal list, reducing two to varieties, sinking two as synonyms, and transferring the general position of three others. Gypsonoma parryana from Alaska, and G. nebulosana from Labrador (Strawberry Harbor and Hopedale) are included. Copy seen: DLC.

45495. HEINRICH, CARL, 1880—. Revision of the North American moths of the subfamilies Laspeyresiinae and Olethreutinae. Washington, D. C., 1926. v, 216 p. 2 illus., 76 plates. (U. S. National Museum. Bulletin 132.)

Historical review, classification, characters of the subfamilies are given, with note of larval habits and economic importance, a comparative table of structural characters, keys to the genera and species, and phylogenetic tree. Systematic list is presented of 35 genera, 223 species and nine varieties, of which 16 genera, 34 species and three varieties are described as new. Ten species are recorded in Alaska, Greenland and northern Canada, among them: Aphania strigosa n. sp. from Dawson.

45496. HEINRICH, GERD H. Holarctic element among the Ichneumoniae of Canada. (Canadian entomologist, Nov. 1956. v. 88, no. 11, p. 647–52.)

Contains descriptions of the palaearctic genera and of eight species and subspecies not hitherto recorded from America: one species and two subspecies are new. Ichneumon computatorius nearctivernus n. ssp. (Alaska, Northwest Territories, northern Ontario), Hybophorellus injucundus nearcticus n. ssp. (NWT.), Trogus lapidator (Yukon Territory) and Ctenamblyteles homocerus (Alaska, Yukon and NWT.), are included.

Copy seen: DSI.

45497. HEINRICH, GERD H. Ichneumon lariae Curtis; a critical study on this arctic species and its closely related forms. (Canadian entomologist, Dec. 1956. v.

88, no. 12, p. 686-91.)

This ichneumon fly is discussed, and a redescription offered on the basis of four specimens from Greenland (Sønderstrøm Air Base), two from Baffin Island (Cape Dorset and Nettiling Lake), and one from Southampton Island (Coral Harbour). Three new subspecies are described: subarcticus n. ssp. (Northwest Territories, northern Manitoba and northern Quebec), labradoris n. ssp. (Hopedale, Labrador, Newfoundland), and asiaticus n. ssp.

(Kharaulakh khrebet in Lena River basin). *Ichneumon alpestriformis*, a related species, is recorded from Alaska (St. Paul and St. Matthew Islands).

of Finland; Hym., Brac.

Contains a critical revision of this hymenopterous subfamily, with synopses of the genera and species and an annotated systematic list of 18 species (one new). Among them are Earinus delusor from Finnish Lapland, and Agathis nigra from the Pechenga region, Kola Peninsula. Copy seen: MH-Z.

45509. HELLIWELL, ROBERT ARTHUR, 1920-, and others. The "nose" whistler, a new high-latitude phenomenon. (Journal of geophysical research, Mar. 1956. v. 61, no. 1, p. 139-42, illus.) Other authors: J. H. Crary, J. H. Pope, and R. L. Smith.

Two spectrograms are reproduced of a new type of whistler recorded by the Geophysical Institute at College, Alaska (geomagnetic lat. 65°). It is characterized by the conventional descending trace as well as rising parts lasting 0.1-0.2 sec. and extending roughly 1,500 cps. on either side of the starting frequency. This unusual shape of the trace has led to the term nose whistler. A possible explanation of this type of whistler is formulated.

Proceedings of the Eastern Muskeg Research Meeting, February 22, 1956. Ottawa, Oct. 1956. Technical memorandum, no. 42, p. 31-40, text map, 2 graphs, table.)

Muskeg is chief terrain hazard in oil development in the western Canadian sedimentary basin. Exploration and exploitation operations (drilling, production, pipelining), are described; initial and maintenance costs of wells, access roads, bridges, etc., are noted and amounts attributable to muskeg problems specified. Research on new or better equipment for muskeg areas is described, also of work to suit the seasons, long-term planning on engineering problems, drilling methods suitable for muskeg.

45517. HENDERSON, ERIC P. Large nivation hollows near Knob Lake, Quebec. (Journal of geology, Nov. 1956. v. 64, no. 6, p. 607-616, 3 illus., text map, diagrs., cross-section.) 8 refs.

Well developed hollows associated with snow patches occur in glacial drift on north-facing slopes in the area 54°30'-45' N. 67°15′-45′ W., about 30 mi. southwest of Knob Lake. Hollows originated through the sapping and erosive action of freeze-thaw processes acting on saturated ground under or along the edges of snow patches. Two stages of development are apparent: simple hollows formed by nivation erosive processes; complex forms evolved when collapse of the backwall has modified simple hollows. Hollows are stabilized at present. apparently formed under a colder climate and/or heavier precipitation than today, possibly during the "little ice age" in late postglacial time. Copy seen: DGS.

45520. HENNIG, RICHARD, 1874-1951. Antike und mittelalterliche Fahrten in den hohen Norden. (Polarforschung, 1954, pub. 1956. Bd. 3, Heft 1-2, Jahrg. 24, p. 282-86.) Text in German. Title tr.: Voyages to the far North in antiquity and the Middle Ages.

Contains survey of the earliest references in the literature to voyages made to northern regions. Such scientific knowledge of the northern regions as the ancients possessed was based on the voyage of the Massiliot Pytheas to the north of Schleswig-Holstein using northern Scotland as the point of departure. The midnight sun was mentioned by Pomponius Mela (40 A. D.), but actual penetration into arctic and subarctic waters was not accomplished until the Middle Ages. Ocean voyages by the Irish and Norsemen during the 7th-9th centuries, and the numerous Norse voyages since 981, including those of Eric the Red, are not considered among travels into the arctic zones. Polar voyages during the close of the 12th century probably reached as far as 80° N. lat., with the discovery of Spitsbergen believed to have occurred in 1194. A brief description of the settlement of Greenland's west coast during the late 13th and 14th century is given. Polar travels ceased in the 15th century and started again in the mid-16th with Chancellor's voyage to the mouth of the Dvina River (1553-1554). Copy seen: DLC.

45528. HERBERT, CHARLES H. The development of transportation in northern Canada. (Association of American Geographers. Annals, June 1956. v. 46, no. 2, p. 250–51.)

Abstract of paper presented at the 52nd Annual Meeting of the Association, Montreal, Apr. 1–5, 1956. Transportation is the greatest problem in economic development of the Northwest Territories. Mackenzie River transport is cheap but handicapped by long winters, rapids,

shifting channels, etc. High costs restrict freight shipped by road from Grimshaw, Alta., to Great Slave Lake. Aviation has done much to open up the North. Transportation proposals include railway to Great Slave Lake, expansion of highway network, and increase in scheduled air routes.

Copy seen: DGS.

**45529. HERBERT, CHARLES H.** The development of transportation in the Canadian North. (Canadian geographical journal, Nov. 1956. v. 53, no. 5, p. 188–95, 13 illus., text map.)

Reasons for high transportation costs are considered, and comparisons made between facilities and routes in Yukon and Northwest Territories. Briefs presented to the Royal Commission on Canada's Economic Prospects stressed importance of improved transportation to mineral development, urged construction of resource development roads, railway to Great Slave Lake, and air servicing of arctic defense installations by commercial air routes acting as common carriers. Possible costs and benefits are discussed, with particular attention to the Great Slave Lake railway and region. Adequate transportation is not only essential to encouragement of exploration and development but is needed to alleviate economic conditions of the furtrapping population. Copy seen: DGS.

**45530. HERBERT, CHARLES H.** Mineral prospects and problems. (Western miner, Oct. 1956. v. 29, no. 10, p. 76–79, 4 illus., port.)

Contains survey of exploration and development in Northwest Territories and Yukon, stressing the sparseness of population and small development of natural resources in relation to the great size and richness of the area. Discoveries and promising prospects in lead and zinc, nickel and copper, iron ore, and petroleum are discussed. Major obstacles to mineral development are high transport costs and lack of transport facilities as emphasized by Commissioners of both Territories in briefs presented to the Royal Commission on Canada's Economic Prospects in Nov. 1955. Importance of development roads, and need for railway from Grimshaw, Alta., to Great Slave Lake, were stated. Greater time required to bring new mines into production in the North was shown and easing of tax laws for such mines was discussed. Copy seen: DGS. **HERGET, H. M.,** see National Geographic Society. National Geographic on Indians . . . 1955. No. 46941.

Account of investigation begun in 1950 with the aim to ascertain the cause(s) of high losses among the geese on the Pea Island Refuge in North Carolina. Age, weight, sex and parasite load were determined in 1,339 birds. Gizzard worm infections were found to cause most widespread and severe damage, amounting to 90 percent in healthy and 100 percent in sick animals. Coccidia and nutritional factors are also considered as causes of the high death rate.

A new lichen from Evans Island, Southeast Alaska, named after its discoverer Lecanora eyerdamii, Herre is described. It was found on a decorticated trunk of Alaska spruce. Copy seen: DA.

45536. HERZOG, ROLF. Eine russische Handschrift von sprachwissenschaftlicher und völkerkundlicher Bedeutung. (Ethnographisch-archäologische Forschungen, 1953. Bd. 1, p. 119–26, illus.) 13 refs. Text in German. Title tr.: A Russian manuscript of philologic and ethnologic importance. Previously listed as No. 40352.

Describes an 18th century 150-page Russian manuscript at the University of Göttingen Library and speculates on its authorship. Written by various hands without indication of author, the manuscript consists mainly (two thirds) of a vocabulary in Latin, Greek and Russian transliteration of 300 words of 34 peoples, mostly from Siberia, including: Ostyak, Yeniseian, Tungus, Samoyed, Vogul, etc.

The remaining part is advice for conducting ethnographic studies in Siberia. The theory is advanced that the manuscript was compiled by G. F. Müller (cf. No. 36367), historian and member of the second Bering expedition who is known to have prepared word lists during his travels in Siberia, and not by his successor J. E. Fischer (cf. No. 34681) who brought the manuscript to Göttingen but was unfamiliar with some of the languages recorded.

45537. HESSELBERG, THEODOR, 1885—, and B. J. BIRKELAND. The continuation of the secular variations of the climate of Norway 1940–50. Bergen, A. S. John Grieg, 1956. 40 p. illus., diagrs., maps, tables. (Geofysiske pub-

likasjoner, v. 15, no. 5.)

Continuation of four studies (No. 7045, 45538) based on data prior to 1940. Departures from mean annual and seasonal values are tabulated for atmospheric pressure, air temperature, and precipitation for the period 1901–30 after 30 years smoothing. Departures from the mean values for the period after ten years smoothing are also tabulated. Variations are graphed. The climatic changes in the period 1940–50 are characterized by an augmented use of pressure, a slower rise of temperature, and small variations in the amount of precipitation. Copy seen: DLC.

45538. HESSELBERG, THEODOR, 1885—, and B. J. BIRKELAND. Säkulare Schwankungen des Klimas von Norwegen; Teil 4, die Feuchtigkeit. Oslo, Grøndahl, 1944. 49 p. graphs, maps, tables. (Geofysiske publikasjoner, Norske videnskaps-akademi i Oslo, v, 15, no. 2.) Text in German. Title tr.: Secular changes in the climate of Norway;

pt. 4, humidity.

Secular variations in humidity are shown to exist by an adjustment over a period of 30 years. The period for which data were used (1860–1940) showed an increase in relative humidity in Norway on the average of 1.5 percent. At the same time, the vapor pressure increased by about 5 percent. By comparison between the changes in air currents and humidity during the period 1876–1905 until 1906–1935, and from 1912–1921 until 1926–1935, an agreement was shown to exist, manifested by increasing southerly and westerly air currents which cause an increase in humidity, while northerly and easterly air currents cause

a decrease in humidity. Orographic conditions cause relative humidity to decrease on descending from mountains and to increase on ascending. In Spitsbergen an increase in vapor pressure during all seasons was shown in connection with the general heating. Deviations of relative humidity from mean values are tabulated for some ten stations including Bergen, Trondheim, Bodø, and Tromsø.

45542. HEUBERGER, JEAN CHARLES. Mesures de températures dans l'ice-cap du Groenland. (Geofisica pura e applicata, 1956. v. 34, no. 2, p. 71-73.) Text in French. Summary in English. *Title tr.:* Measures of temperatures in the Greenland icecap.

In reply to Kurt Wegener's assertion (cf. No. 43263) that results obtained by the Expéditions polaires françaises in 1950 are contradictory to those obtained by the Germans in 1930-31. The measurements by the two parties are not comparable due to differences in the size of the bore holes and to the fact that the upper firn layer (down to 15 m.) is affected by temperature changes in the air above. The accuracy of the instruments used in 1950 is considered satisfactory.

45562. HØEG, OVE ARBO, 1898—. The present and past vegetation of Spitsbergen. (Linnean Society of London. Proceedings, Feb. 1956. v. 166, pt. 1–2, p. 144–49.) 12 refs.

Vascular plants in Vestspitsbergen comprise 113 species. These are adapted morphologically to extreme climatic conditions and capable of self-pollination or vegetative reproduction. A number of species are common to Spitsbergen and Norway; another group, found in Spitsbergen, North Greenland, and Novaya Zemlya, and very rare in Scandinavia, seem to have survived at least the last ice age in Spitsbergen. No fossil plants from any geological formation show morphological characteristics possessed by

present flora. Production of organic matter by present vegetation is very slight, whereas in Devonian through Tertiary strata, coal has been found repeatedly, indicating a relatively warm, humid climate. Problems relating to climatic change and ecology of arctic forests are suggested. **Copy seen:** DGS

45567. HÖLTER, HERMANN. Armee in der Arktis; die Operationen der deutschen Lappland-Armee. Bad Nauheim, H. H. Podzun, 1953. 67 p. maps. Text in German. *Title tr:* Army units in the Arctie; the operations of the German Lapland-Army Corps.

Contains description of the battles of German units on the Lapland front during 1941-1944. The land front extended from Kiestinki to the Rybachiy Peninsula for 650 km., and the sea front from Petsamo Fjord to Nordkyn for 600 km. The corps along the polar sea was supplied by sea along the Norwegian coast, whereas the units near the Arctic Circle were supplied via the Baltic Sea. Purpose of the operations was the capture of the Murmansk railroad and Kola Bay with the port of Murmansk. The relationship between Germans and Finns during the German-Finnish coalition fight is described. A detailed description is given of Operation "Birke" (Sept. 3, 1944) designed to move German forces from the Louhi and Kandalaksha fronts northward for the establishment of new positions along the polar sea south of Ivalo Kautokeino. Operation and "Nordlicht" was designed to release units for the hard pressed forces east of the Petsamo nickel mines, those near the Salla road, and those approaching Rovaniemi from Kuusamo in the winter of 1944 after the Russian-Finnish armistice agreement. The author was German chief of the general staff in the high command of the Finnish Army and served as chief of the general staff of various commands in the North.

45573. HOFSTEN, NILS von, 1881—. Rotatorien der nordschwedischen Hochgebirge. (In: Hamberg, A. Naturwissenschaftliche Untersuchungen des Sarekgebirges in Schwedisch-Lappland, 1907—1939. Bd. 4, Zoologie, Lfg. 8, pub. 1923. p. 829—94, 12 illus.) 67 refs. Text in German. Title tr.: Rotatoria of the high mountains of northern Sweden.

Contains a systematic annotated list of about 80 species of fresh-water rotifers, based chiefly on the author's observations in Torne Lappmark (Abisko, Torne Träsk) in 1907 and 1908, in the Sarek Mountains (1911, 1916), and the mountains of Jamtland; two species are new and 14 new to the fauna of Sweden. Rotifer plankton of the northern Swedish lakes is compared with that of the boreal region; its distribution and elements are discussed. Cosmopolitan arctic species frequent in northern Swedish mountains (at least 25) and 17 arctic species less frequent are considered. Other elements of the fauna are also noted.

45575. HOGUE, DONALD W. Temperatures of northern North America. Natick, Mass. June 1956. 62 p. 13 text maps, 7 tables. (U. S. Quartermaster Corps. Environmental Protection Research Division. Research study report RER-9.) 41 refs.

Contains data from 169 weather stations distributed at intervals of approx. five degrees of latitude and longitude in Alaska, Canada, Greenland, and Iceland; stations were selected primarily for geographic location and length of record: those with less than 10 yrs. being used only where no other data were available, the Greenland icecap represented by a one-year (Eismitte) and a two-year (Central Station) record. List of stations (with latitude, longitude, and elevation) is followed by tables of mean temperature, mean daily maximum and minimum, absolute maximum and minimum, and temperature frequencies. The mean monthly temperature is depicted by a map for each month with isotherms at 10° intervals. A brief analysis of the maps and a bibliography of data sources are given. Copy seen: CaMAI.

45578. HOIJER, HARRY. Athapaskan kinship systems. (American anthropolo-

gist, Apr. 1956. v. 58, no. 2, p. 309–333,

tables.) 36 refs.

Attempts to determine the pattern of kin group characteristics and the form and meaning of the original kinship terminology in proto-Athapaskan. Cognate sets (73) of kin terms are assembled from the daughter languages: Tanaina, Ingalik, Tena, Tanana, Kutchin, Loucheux, Hare, Bear Lake, Kaska, Tahltan, Tsetsaut, Slave, Yellowknife, Chipewyan, Sekani, Beaver, etc. The kinship categories represented are compared in tabular summary. Copy seen: DLC.

**45579. HOIJER, HARRY.** The chronology of the Athapaskan languages. (International journal of American linguistics, Oct. 1956. v. 22, no. 4, p. 219-

32, tables.) 16 refs.

Discusses the glottochronology of 15 Athapaskan languages, including Beaver, Carrier, Chipewyan, Hare, Kutchin, Sarcee, using 100 common words (cf. No. 37676). The time of their separation from main stock and their interdivergence are computed: t (time of separation) = log C (percentage of cognates shared) ÷ log r<sup>2</sup> (index of retention, i. e. approx. 81 percent in 1,000 years). The results are analyzed and tabulated. The importance of geographical factors (distance, mountains, etc.) in linguistic divergences is noted, also the comparatively recent break-up of the Athapaskan group (1,300 to 500 years ago). Copy seen: DLC.

**45580. HOLAHAN, JAMES.** Pendulous gyro points way to true North. (Aviation age, Apr. 1956. v. 25, no. 4,

p. 82-87, illus., diagrs.)

A practical gyro compass for aircraft use is described. The subminiature gyro weighs 23 lb. and measures about 8 in. in diameter and 10.5 in. in height. The sensitive element is essentially a fluid-suspended gyro, and no bearings of any type are used, which eliminates friction torques. Three modes of operation are possible: gyro, slaved, and directional gyros. The directional gyro mode is especially useful above 80° lat. The drift rate in this mode is only one-tenth degree per hour. Copy seen: DLC.

45581. HOLCOMBE, RICHARD M. Similarities and contrasts between the arctic and antarctic marine climates. Washington, D. C., U. S. Hydrographic Office, 1956. 13 p. Mimeographed. 12 refs.

Compares physical features (topography, area of pack ice) of the two regions, surface temperature, cyclones, regions of divergence and convergence, precipitation, gale frequency; also upper air wind and temperatures (based on data from Little America, Antarctica, and from Alert, Ellesmere Island).

Copy seen: DN-HO.

**45582. HOLDEN, R. L.** Raytheon facilities: environmental test laboratory. (Electronic progress, Sept.-Oct. 1956.

v. 1, no. 2, p. 8, illus.)

Contains a brief description of Raytheon test chamber facilities currently in use. Temperature limits range as high as -73° to +120° C. Some extreme weather conditions are given at which ground equipment may be exposed. These include operating temperatures from -80° to +125° F., snow loads up to 40 lb./sq. ft., and penetration and abrasion of blowing snow crystals 1-3 mm. in diameter with a wind of 40 m. p. h. and 0° F. temperature.

45592. HOLMES, ROBERT WILLIAM. The annual cycle of phytoplankton in the Labrador Sea, 1950–1951, Kingston, R. I., 1956. 74 p., 2 text maps, graphs, diagrs., 2 tables. (Rhode Island. University. Narragansett Marine Laboratory. Biological Oceanography Project. Reference no. 56–15, Technical report no. 8.) 49 refs. Also pub. as: Yale University. Peabody Museum of Natural History. Bingham Oceanographic Collection. Bulletin, Mar. 1956. v. 16, article 1.

Phytoplankton samples collected at Ocean Weather Station B (56°30' N. 51° W.) approx. fortnightly during 1950-1951 at 0, 25, 50, and 100 m. were given to the author for study. Zooplankton from the same location were described by W. V. Kielhorn, No. 30053. Annual cycles of diatoms, "flagellates," dinoflagellates, and ciliates are discussed individually, and a species list (approx. 120) is given with remarks on occurrence and taxonomy. Almost continuous coexistence of allochthonous and autochthonous elements is disclosed. The most significant allochthonous contribution appears to be made by the West Greenland and Irminger Currents: contribution from Labrador Current seems relatively unimpor-Diatom and dinoflagellate cycles are closely parallel, both groups exhibiting blooms in June and Sept. Smaller phytoplankton species (nannoplankton) are a substantial part of the total population. Major changes in phytoplankton abundance probably result from changes in solar radiation, stability, zooplankton, Copy seen: DN-HO. and nutrients.

45593. HOLMSEN, PER, 1911— . Hyolithus-sonens basale lag i Vest-Finnmark. (Norway. Norges geologiske undersøkelse, 1956. nr. 195, Årbok 1955. p. 65–72, 2 illus., sketch map, section.) 5 refs. Text in Norwegian. Summary in English. Title tr.: Basal layers of the Hyolithus-zone in West Finnmark.

"Hyolithus-zone" denotes the autochthonous lower Cambrian substratum of the Caledonides, which can be followed from Laksefjord, North Norway, south through Finland and northern Sweden. The area described is approx. 69°25'-35' N. 23°-24° E., south of Altafjord. The four members of the formation (quartzite and/or conglomerate, lower shale, sandstone, upper shale) are present in almost every section. Total thickness of the zone in this area varies from 50 m. in the west to 100 m, in the east. In several places the basal member of the formation does not lie directly upon the Precambrian basement, but is underlain by a thin bed of Eo-Cambrian tillite presumed to be of continental origin. term "Varanger ice age" is proposed for the geologic age of this tillite.

The results of seismic refraction and

reflection measurements are reported in detail, and the equipment and computation methods used are described. Studies made in the firn-covered area between Camp Alpha and the dome S. of Inglefield Land (northwest Greenland) on the variations in wave velocity as a function of the distance of propagation revealed the presence of two distinct zones; a lower layer with a velocity of 12,600 ft./sec. and an upper layer approx. 300 ft. thick with a variable and higher The high-velocity layer invelocity. dicates that the entire sector is in an accumulation zone and therefore cannot be completely melted in summer. The firn limit of the dome is located about three-four mi. from the edge of the ice cap. Solid ice was found in this zone under two ft. of melting snow. The absence of crevasses in the area is attributable to the relatively flat bedrock. The ice thickness at different points varies from 690-4,500 ft. Derived values of velocity, time-distance graphs, velocity vs. depth, examples of initial and reverse direction, multiple reflections, and cross sections of the icecap are included.

45597. HONIGMANN, JOHN JOSEPH, 1914- . The Attawapiskat Swampy Cree; an ethnographic reconstruction. (Alaska. University. Anthropological papers. Dec. 1956. v. 5, no. 1, p. 23-82.) 38 refs.

Writer's purpose is to delineate culture and way of life of Indians of northern Ontario, west of James Bay, south of the Hudson Bay, before they were affected by contact with Europeans (who entered the area in early 18th century). Data on the ancient culture patterns were collected among the Swampy Cree at Attawapiskat trading post and mission between 1947 and 1955, with the aid of (mainly) two native informants, George Kiiookii and Jacob Atooket. These Cree formerly ranged from the Kapiskau River (52°30′ N.  $83^{\circ}-85^{\circ}$  W.) north to Hudson Bay and their aboriginal lifeways persisted longer inland along the Sutton River, than on the James Bay coast. Their nomenclature, environment, basic tools and techniques, calendar, food, hunting and fishing, housing, clothtransportation and travel are treated in turn. Recreation, social relations, kin behavior, religious concepts and observances, shamanism, healing and sorcery are described as they persist in the informants' recollections and in contemporary practice.

45600. HOOSE, HARRY MEADE, 1919— October gales in Southeast Alaska. Washington, D. C., U. S. Weather Bureau, Feb. 1955. 12 p. 6 charts, table. Mimeographed. 2 refs.

"The most hazardous storms to affect the fishing fleets . . . are the Oct. cyclones which bring E or SE gales after periods of relatively good weather. Two types are recognized: (1) shallow, rapidly developing and moving cyclones which pass northeastward over the Juneau area into Canada; and (2) deep cyclones which move into the Juneau, Cape Spencer area and stall or weaken while a new center forms in the lee of the Cordillera. Type 1 begins as a wave on a cold front or occlusion; type 2 is usually the first or second occluded wave of a series. Characteristics of four type 1 storms and four type 2 storms in 1950-53 are described and tabulated, and six synoptic charts for a type 1 storm (Oct. 6-8, 1951) are presented and analyzed."-Meteorological abstracts & bibliography, Feb. 1956.

45601. HOOSE, HARRY MEADE, 1919- . Search for an objective method of forecasting precipitation in Southeastern Alaska. Washington, D. C., U. S. Weather Bureau, Feb. 1955. 9 p.

2 tables. Mimeographed.

"Several parameters were tested to find best objective method . . . especially at Juneau. The most promising variables for spring, summer and fall were found to be: 1, 850 mb. flow (height of 850 mb. surface at Annette, Alaska minus height at Yakutat (ANN-YAK)) indicating onshore flow; 2, potential temperature change in past 24 hours at tropopause indicating advection of cold tropical or warm arctic air; 3, advection at 700 mb.; and 4, persistence (precipitation or no precipitation at time of forecast). Stability and 24-hour temperature change at 700 mb. made little difference. Forecasts verified 85 percent, against 69 percent for official forecasts."-Meteorological abstracts & bibliography, Apr. 1956. v. 7, no. 4, p. 447.

45604. HOPKINS, DAVID MOODY, 1921-, and W. S. BENNINGHOFF. Evidence of a very warm Pleistocene interglacial interval on Seward Peninsula, Alaska. (In: Alaskan Science Conference... 1953. Proceedings, pub. 1956, p. 163.)

Fossil flora interbedded with glacial and periglacial deposits suggest that early Quaternary interglacial intervals in northwest Alaska were characterized by much warmer and more humid climate than at present; and that early glacial climates had longer, warmer summers and much heavier winter precipitation. Evidences for early Pleistocene climates have not been reported from other parts of Alaska.

HOPPE, GUNNAR, 1914-45608. and G. H. LILJEQUIST. Det sista nedisningsförloppet i Nordeuropa och dess meteorologiska bakgrund: 1, Inlandsisen och dess klimatologiska miljö av G. Hoppe. 2, Meteorologiska synpunkter på istidsproblemet av G. H. Liljequist. (Ymer 1956. årg. 76, häfte 1, p. 43-74, illus., maps.) Approx. 40 refs. Text in Swedish. Summary in Title tr.: The course of the English. latest glaciation in northern Europe and its meteorological background: 1, The inland ice and its climatological setting, by G. Hoppe. 2, Meteorological viewpoints on the ice age problem, by G. H. Liljequist.

The last ice age began in the mountains of Scandinavia under conditions, as now, of prevalent westerly winds. In time, with increasing frequency of southeasterly winds, the ice culmination, and with it the ice divide, moved eastwards towards the Gulf of Bothnia. The meteorological evolution was a gradual return, with temporary regressions, to conditions similar to those of the present time. The Sarek region (67°27′ N. 17°40′ E.), which has at present the highest pre-

cipitation and the greatest number of glaciers in Sweden, was during the final phase of the glaciation a center of marked glacial activity. This final phase is treated in some detail, partly on the basis

of new observational material.

The beginning and end of an ice age are assumed, in the second article, to be caused by an increase and decrease, in amount of cloud in tropical and subtropical regions. This results in changes in the total albedo, i. e. gain in radiation energy, and therefore in warm air production in these regions. With changes in the radiation balance of the atmosphere and the earth's surface, the circulation patterns of atmosphere and sea change, and in turn lead to other changes, which may even further stress the variations which have occurred, until a state of quasi-equilibrium is reached. changes in cloudiness may be caused by variations in the output of ultraviolet radiation from the sun which may lead to an increase in the number of condensation or sublimation nuclei in the atmosphere. 45630. HUBLEY, RICHARD CARLETON. The role of heat transfer by radiation in melting of glaciers. (American Meteorological Society. Bulletin, May 1956. v. 37, no. 5, p. 238.)

Abstract of paper presented at the 145th National Meeting of the Society, Seattle, June 12-14, 1956. From study of surface energy exchange data from the Juneau Icefield, Southeast Alaska, and glaciers in Washington State and Austria, author concludes (1) direct effect of variations in intensity of solar radiation as cause of variation in radiative transfer of heat to the glaciers is negligible; (2) relatively small changes in glacier albedoes lead to significant changes in the net energy transfer by radiation at the glacier surface; (3) on overcast days during the ablation season the net radiative heat transfer to snow and firn on glaciers in the Juneau Icefield may be as much as 50 percent greater than on a clear day. Copy seen: DGS.

in the Skaergaard intrusion, East Greenland, and related sills injecting the lavas. København, C. A. Reitzel, 1956. 27 p. illus., text map, diagr., table. (Meddelelser om Grønland. Bd. 137, nr. 2.) 12 refs.

In summer 1953, the author visited Skaergaards Halvø (68°09' N. 31°45' W.) as a member of the British East Greenland Geological Expedition, led by L. R. Wager and W. E. Deer. Field work was undertaken on the Skaergaard, Kangerdlugssuaq, and Kap Edvard Holm Tertiary igneous complexes. basic sills are described from the Skaergaard area . . . Two are intrusive into Tertiary lavas; parts of the third, the Basistoppen Raft, are preserved as a large inclusion in the Skaergaard gabbro complex. All three have a basal picrite resulting from gravity settling of early olivine crystals. The subsequent course of crystallization is described from the least altered sill, the Basistoppen Raft, in which the mineral sequence is closely similar to that of the Palisades Sill."-Author's abstract. ì

1

Feed supply, weather, and insect pests determine reindeer migrations between upland and lowland locations. The historical development and commercial bases of reindeer husbandry are reviewed. The Lapps' adjustment to the sedentary Swedish population penetrating into lowland regions of Gällivare is discussed. Changed relationships between reindeer and fishing Lapps are explained, as fewer men migrate with herds. Lapp housing has changed with the general discontinuation of migration of whole families. Education makes the Lapp both competitive in non-agricultural activities and better able to maintain the nomadism necessary in reindeer husbandry. Census figures are given for both Lapps and reindeer in earlier and recent times. All of these changes indicate trends in a governed nomadism. Effects of Russian and Norwegian restrictions on Swedish Lapp nomadism are also considered.

45645. HULTÉN, ERIC, 1894- . The isolation of the Scandinavian mountain flora. (Societas pro fauna et flora fen-Acta, 1955. v. 72, no. 8, p. 1-22, nica.

30 text maps.) 49 refs.

Study of the geographic distribution of this flora, isolated from Central and South European mountains and connected with a world-wide area through the arctic and subarctic parts of Russia to the Urals. The mountain plants are grouped as: endemic plants; species completely isolated in Scandinavia; species with very wide gaps in their area; northern species (in six subgroups according to their gaps); and species occurring also on the mainland between southern Kanin and the Urals. For each of these five groups, species are listed, and ranges are mapped for 30 typical plants. About two-thirds of the mountain plants are more or less isolated in the Scandinavian mountains and Kola Peninsula. More than a hundred have gaps as wide as from Kola Peninsula to the Urals. The isolation may have been caused by lack of suitable habitats or by changes in the climate (glaciation). Copy seen: DSI. 45646. HULTKRANTZ, ÅKE. Swedish research on the religion and folklore of the Lapps. (Royal Anthropological Institute of Great Britain and Ireland. Journal, Jan.—Dec. 1955. v. 85, pt. 1–2,

p. 81-99.) Approx. 200 refs.

Fourth in a series of reviews of Scandinavian scientists' work on Lapps (cf. No. 20624, 22122, 24157). Emphasis is on present-day Swedish studies (to 1954) in the field of religion, including survival of paganism in superstitions, shamanism and its relationship to Siberian and circumpolar magic practices; also on folk science, customs, literature, art, and music. Urgency of field recording and contribution to be made by Lapp scholars are stressed. Copy seen: DLC.

45647. HUME, DAVID M., and others. The effect of hypothermia on pituitary ACTH release and on adrenal cortical and medullary secretion in the dog. (In: National Research Council. Division of Medical Sciences. The physiology of induced hypothermia . . . symposium, Oct. 1955, pub. 1956. p. 170-74, illus.) Il refs. Other authors: R. H. Egdahl and D. H. Nelson.

Hypothermia in traumatized dogs depressed the output of pituitary ACTH and of adreno-cortical secretion which were elevated by the trauma. Adrenal sensitivity to exogenous ACTH, as well as secretion of epinephrine and norepinephrine were sharply reduced by hypothermia. Cold exposure without hypothermia did not change adrenal responsiveness to ACTH.

45650. HUNTER, HUGH EDWARDS, 1915— . Geology of the Melvin Lake area, Granville Lake mining division, Manitoba. Winnipeg, Queen's Printer, 1952. 16 p. fold. map 30 x 42 in., table. (Manitoba. Dept. of Mines and Natural Resources. Mines Branch. Publication 51-5.) 5 refs.

Map (scale 1 in.: 1/2 mi.) covers the area 57°00'-15' N. 100°07'30"-22'30" W., including northern Barrington Lake, about 140 mi. north of Sherridon. Field work was done in summer 1951. Physical features are described. All rocks are presumably Precambrian. The oldest are metamorphosed sedimentary and volcanic rocks which have been tightly folded and intruded by igneous rocks assigned to two periods. No correlation has been suggested between the oldest rocks of this and other areas of northern Manitoba. Regional structure is obscure. No major fold axes are indicated. Regional foliation is briefly discussed; also possible fault systems. No extensive mineralized zones were observed. Copy seen: DGS.

45656. HUSTICH, ILMARI, 1911—. Correlation of tree-ring chronologies of Alaska, Labrador and northern Europe. Helsinki, 1956. 26 p. maps, diagrs., tables. (Acta geographica 15, no. 3.) 27 refs.

Attempt to establish whether minimum years of radial growth coincide for the three areas. Biological background, material, and analysis are presented in turn for spruce (Picea). Published records and results of the author's studies in Labrador are used, the main series: 1946-1800 (table), supplemental data Minimum years in from 1800-1760. radial growth and consequently cold summers seldom occur simultaneously over the whole region. Over wide areas of the same continent and within the same climatic regions, certain minimum years occur simultaneously. Over larger areas and different continents, the spectacular minimum years cease to coincide, but a pattern of incidence may be observed in some cases. Minimum years are tabulated. Such studies may elucidate the problem of annual variation of summer climate in areas where meteorological records are scarce.

Copy seen: DLC.

45657. HUSTICH, ILMARI, 1911— . Lappland lever. Stockholm, Medén, 1946. 250 p., illus., map. Text in Swedish.

Title tr.: Lapland lives.

Important post-war changes in Lapland are recognized. Both people and place are affected by modifications in frontier life. The status of nomadism, biotic and commercial effects on nature, education and adjustments of local people, influx of new residents, and increased contacts with the world are summarized in comparisons between the Norwegian, Swedish, and Finnish Lapp districts. Mining, fishing, forestry, and agriculture are considered. With a fourth of the workers of Lapland engaged in industry and communications, it ceases to be a primitive region although many Lapps are quite unaffected by the changes. The book, one of several on Lapland by this author, is based on many years' acquaintance with the land and its people. Copy seen: DLC.

45658. HUSTICH, ILMARI, 1911—. Notes on the growth of Scotch pine in Utsjoki in northernmost Finland. Helsingfors, 1956. 13 p. 3 diagrs., 4 tables (Acta botanica fennica, no. 56.) 22 refs.

Measurements of growth phenomena of Scotch pines in Utsjoki (approx. 60°30' N.) are compared with earlier work. Growth in thickness, height, length and needle length, and intensity of female flowering are discussed; differences between pines of varying ages, and between main shoot and second order branches, and needle survival are also dealt with; summer temperature is the only limiting factor considered. Radial stem growth and needle growth are greatest in favorable summers, length increase and intensity of female flowering the year Use and misuse of mean following. climatic values, of measurements where climatic factors are complex, and of small sample studies are cited.

45664. HUZIOKA, TOSIO, and Y. HIKITA. Studies on the resistance of a snow sledge, II; friction between snow and iron plate. (Teion-kagaku, Low temperature science, Sapporo, 1954, ser. A, no. 13, p. 37–47, illus., table, graphs.) 6 refs. Text in Japanese. Summary in English.

"A flat iron ring was brought into contact with rotating sheets of compacted snow and tap-water ice at ambient temperatures of -20° to +4° C., and values of frictional resistance were de-

termined from electrical measurements of moments of rotation transferred to the ring. Rotational-speed differentials at the beginning of each trial were 0.6, 1.8 and 38 cm./sec. Most trials showed a linear ratio of frictional resistance to load, but deviations were noted for extremes of temperature and speed. The friction coefficient for snow below 0° C. decreased with increasing temperature, was minimum a few fractions of a degree below 0° C. and increased rapidly with temperatures above 0° C., and remaining constant above 0° C. for ice. These results seem to contradict Bowden's statement that the decrease in the friction coefficient with increasing temperature is due to meltwater produced by frictional heat. The experimental data are tabulated and graphed."—SIPRE.

"The static and kinetic friction of a man-hauled, iron-runner sled on fresh and compacted snow were measured electrically for vertical pressures from 27-310 gm./sq. cm. and temperatures from  $-10^{\circ}$  to  $+5^{\circ}$  C. The results are compared with those of other investigators. The coefficient of static friction on hard snow varied from 0.2-0.5, and that of kinetic friction from 0.12-0.17. Resistance to motion was proportional to the total weight of the sled and was higher for fresh than for compacted snow. The additional force required by the curved parts of the runners to break down the fresh snow was proportional to the product of the volume of snow compacted and the energy needed to break down a unit volume of fresh snow. No definite relation was found between static friction on compacted snow and temperature" .-SIPRE. Copy seen: DLC.

45672. TAKOVLEV, GURIŤ NIKOLAE-VICH. Study of the morphology of the ice cover by surveying. Washington, D. C., 1956. 22 p. diagrs., illus., tables. (In: Somov, M. M. Observational data . . . drifting station 1950-51, pt. 5, translated by David Kraus.) Appendix of data tables paged 72-102 as in original Russian edition.

The results of investigations from May-Sept. 1950 at the drifting station North Pole-2 north of Bering Strait are reported in detail and discussed, and the surveying methods and instruments used are described. Studies were made on the changes in the ice surface due to the melting of ice of varying ages; on the possibility of maintaining a level ice surface during the melting period in areas with and without such cover, with and without artificial drainage of meltwater, and covered with shavings to delay melting; also on the preservation of the surface relief during melting along the axis of the airfield on one-yr.-old ice and on old ice before and after flooding. Data are tabulated and grouped on daily changes in relief of each area tested, and maps and profiles of the test areas are given. Copy seen: CaMAI.

Reports results of observations made four times daily Apr. 15, 1950-Apr. 7, 1951 at five points on the drift station North Pole-2 on the temperature of snow, bare and snow-covered old and new ice at the surface and to a depth of four meters, of water under the ice, and of surface pools. Characteristics of the ice and snow at the measuring points, the methods of measurement, instruments used, and data analysis are described. Changes in ice strength and its structural characteristics, as well as of snow density with temperature were also studied. Data are tabulated and graphed on the the amplitude of the mean monthly ice temperature at various levels, changes in mean crushing strength, in each layer of one-yr. old ice, differences in the temperature of bare and snow-covered ice at various levels for each month from May-Jan., snow densities and mean snow depths for selected periods, average, min. and max. snow and ice temperatures at each test point for each hr. of observation, their daily and monthly means, maximum and minimum, pool water temperatures, and the salinity of water and ice in the pool.

Reports visual observations made on drifting station North Pole-2, Apr. 4, 1950-Apr. 9, 1951, from 76°03′ N. 193°24′ E. to 81°44′36″ N. 196°12′ E. They supplement instrumental investigations and refer to the melt and growth processes of the drifting ice, the morphology of the ice cover, temperature variations of ice, snow, and freshwater pools, and the physical and mechanical properties of the ice. The phenomena observed daily are described in diary form, photographs and diagrams of the outstanding features of the ice are presented, and maps of the ice field and profiles through the ice are given.-From SIPRE. 45680. ÎATCHENKO, F. I. Sozdanie zashchitnykh lesnykh polos v tundre na Pechorskol zheleznol doroge. (Rastitel'nost' Krainego Severa SSSR i ee osvoenie, 1956. vyp. 1, p. 93–98, illus.) Text in Russian. *Title tr.:* Shelterbelt forest planting in the tundra region of the Pechora railroad.

The Pechora is the most northerly railway line in the Soviet Union; its northern section runs through open tundra and the snow drifts in winter cause trouble. Movable snow fences are expensive to install and maintain; forest shelterbelts are much cheaper and more effective. Preparatory work by silviculturists, brought in by the railroad to study the problem and set up nurseries in Seyda, Vorkuta and elsewhere, is reported. Methods of planting the shelter belts is discussed. The high level of permafrost, strong winds, severe winters with temperatures down to  $-55^{\circ}$  and -60° C., short summers, and poor swampy soils are factors which slow success of planting. Experiments in removing the moss cover and plowing have increased the depth of thawing from one to two meters. Copy seen: DLC.

Description of the skeleton of these marine animals, their occurrence in time and space and present geological significance. Five species are described and their occurrence and geographical distribution discussed. **Copy seen:** DLC.

45682. IBARRA GRASSO, DICK EDGAR. Die letzte Eiszeit als notwendige Voraussetzung für die erste Besiedlung Amerikas; eine neue Theorie über die Herkunft der Altmenschen in Amerika. (Zeitschrift für Ethnologie, 1956. Bd. 81, Heft 2, p. 258–69, maps, diagr.) Refs. in text. Text in German. Title tr.: The last ice age, a prerequisite for the settlement of America; a new theory on the origin of prehistoric man in America.

Advances theory of mild ice-age glaciation of America leaving an ice-free corridor from Alaska inland during the greater part of its duration. The low-ered sea level left the Bering Strait dry, permitting man to cross during the last ice age. New Mexican finds with radiocarbon measurements of over 26,000 years are cited. They belong to a coups de poing culture comparable to the Mousterian but corresponding, probably, to the proto-Solutrean. The Folsom age is compared to the upper Solutrean, and the pre-ceramic Alaskan finds to the mesolithic period of Europe.

Two types of the road reinforcement are described: a log type with logs split in half or heavy boards laid on each side at a 30° angle to the center; and a removable concrete-type assembly with heavy perforated panels laid end-to-end in two rows upon the ground. The panels are 250 x 100 x 16 cm. in size which required 0.17 m.³ of concrete and 16-20 kg. metal, i. e. 220 m.³ concrete and 24 tons of steel, per km. of road. Perforations (holes) in the panel represent about 30 percent of the area. This covering has the advantage of long service, also of disassemblage and re-assemblage on other roads.

Volume of blood flow in the hind limb or foot of dogs was increased during and after rewarming following freezing of the tissues. Cooling to 27° or 15° did not affect the blood flow during post exposure time, but chilling to about 12° C. resulted in an increased blood flow during and after the rewarming period.

Copy seen: DNLM.

45688. IMIG, CHARLES JOSEPH, 1922-, and others. Comparison of blood flow in normally innervated and in sympathectomized legs of dogs after exposure to cold. (American journal of physiology, July 1956. v. 186, no. 1, p. 35-38, illus.) 5 refs. Other authors: W. J. Roberson and H. M. Hines.

During and after rewarming from a  $3\frac{1}{2}$  hrs. exposure to  $-4^{\circ}$  C., an increase in blood flow took place in intact legs; no such increase was observed in sympathectomized limbs. Those findings indicate some vasomotor impairment in the normally innervated leg following its cold-exposure. Copy seen: DNLM.

45689. IMLAY RALPH WILLARD, 1908- . Stratigraphic and geographic range of the early Cretaceous ammonite Homolsomites. (Journal of paleontology, Sept. 1956. v. 30, no. 5, p. 1143-46, illus.) 12 refs.

The Early Cretaceous (Valanginian) ammonite Homolsomites Crickmay . . . is redefined and the name applied to species from California, Oregon, Washington, and East Greenland (Trail Ø; 72°32' N. 23° W.) that have been described under other generic names. The genus is closely related to Tollia Pavlow from the late Berriasian of the Boreal region and is referred to the family Craspeditidae. Homolsomites is commonly associated with the pelecypod Aucella crassicollis Keyserling and the ammonites Polyptychites (including species from northern U. S. S. R.), Neocraspedites, Lyticoceras, and Sarasinella. Specimens from East Greenland were described by Donovan (Arctic Bibliography, No. 28784) and assigned to Dichotomites. Copy seen: DGS.

45690. INDUSTRIAL AND MINING STANDARD. Arctic ore storage plant. (Industrial & mining standard, Mar. 17, 1955. v. 110, no. 2784, p. 10-11, illus.)

New facilities at the iron ore storage and transport plant at Narvik, Norway are described. Two conveyor belts with a capacity of 4000 tons/hr. insure a steady inflow and outflow of ore (cf. No. 39170). The plant modernization required one and one-half years with much of the construction being accomplished during the winter.

Copy seen: DLC.

45691. INDUSTRIAL LABORATOR-IES. Arctic snow, whiteout probe recorders. (Industrial laboratories, Sept. 1956. v. 7, no. 9, p. 68, illus.)

Contains brief description of precision recording instruments used by the Snow, Ice and Permafrost Research Establishment for snow drift and whiteout studies 200 miles inland and 7,000 ft. above Thule, Greenland.

Copy seen: DLC.

45692. INDUSTRIENS UTREDNINGS-INSTITUT, Stockholm. Norrlandsbibliografi. Stockholm, 1944. 63 p. Text in Swedish. Title tr.: Norrland bibliography.

Lists approx. 1000 books and articles on Sweden's northernmost province, to provide social and economic background data in plans for future development. The references, mainly since 1900, are grouped by subject (nature, population, civic development, occupations, and cultural life, with various subgroupings) and were assembled by the industrial research institute in 1940. Over 50 Swedish journals containing Norrland materials are also listed.

Copy seen: DLC.

45700. INTERAVIA. The TACAN system and the results of the Alaska tests. (Interavia, Oct. 1956. v. 11, no. 10, p. 815-17, illus., diagrs.)

Operational characteristics and use of the Tactical Air Navigation (TACAN) System are discussed, and results of tests conducted in Alaska are noted. This system utilizes a thin radar beam between aircraft and fixed ground stations which is translated in the aircraft to read distance and bearing from the ground station. Seventeen ground stations were established in Alaska in the autumn of 1954 and used by a large number of aircraft. The results of the tests established the accuracy and the reliability of the system.

Copy seen: DLC.

45701. INTERNATIONAL CIVIL AVI-ATION ORGANIZATION. Ice and snow on runways. Montreal, 1955. 70 p. 11 illus., 5 figs., 3 charts, 7 tables. (*Its*: Circular 43-AN138.)

Specific problems associated with turbojet operations and their solution in various countries are summarized from discussions held at the Third North Atlantic Air Navigation Meeting held in Montreal, Oct. 1954. The problems considered were: antiskid brakes, special tires, braking parachutes, reverse thrust, special runway construction, snow treatment, and methods of evaluating the coefficient of friction. Mention was made of various types of tires designated to increase braking efficiency under snow, mud, and ice conditions, such as special treads

impregnated with gritty materials, metal spikes and helical springs set in the treads, the latter having proved effective in northern Canada and in the Arctic. Appended is "Article on snow handling on Canadian airports" by D. B. Rees (p. 13-30) describing snow clearing and compaction methods practiced at Gander and Yellowknife among others; equipment used and cost data are tabulated for each airport. Also: "Report on the procedure for correction of minimum runway length under winter conditions at Oslo airport, Fornebu," by O. Kollerud (p. 31-46); and statements (from France) on snow removal at aerodromes, on deicing of runways, taxiways and aprons at aerodromes, and on salt-spreading equipment. Copy seen: DLC.

45702. INTERNATIONAL CIVIL AVI-ATION ORGANIZATION. Implementation Panel. Comments and recommendations on air navigation facilities and services in the North Atlantic region. Montreal, 1956. i, 31 p. diagrs., charts, tables. (Its: Doc 7751, PNL/1.)

An appraisal of air traffic problems and a comprehensive analysis of shortcomings in services and facilities are given for the air route Gander, Greenland, Iceland, and Shannon/Prestwick. One of the major problems is unreliable fixed communications due to the characteristic radio blackouts in subarctic areas. A new technique for point-to-point communications VHF forward scatter system is to be evaluated by ICAO Council in Jan. 1957; and if favorably reported, its installation in Greenland and Iceland is requested. Present and future traffic on the North Atlantic route is discussed briefly. Copy seen: DLC.

45703. INTERNATIONAL COMMISSION FOR THE NORTHWEST AT-LANTIC FISHERIES. Annual proceedings, v. 6, for the year 1955–56. Halifax, N. S., The Commission, Forrest Building, 1956. 74 p. illus. maps, graphs, tables.

Contains three parts: an administrative report (p. 5–8) by E. M. Poulsen; and a report of the sixth annual meeting Halifax, N. S., June 11–15, 1956, by Tavares de Almeida (p. 8–20) which includes a statement of research needs and list of participants.

Pt. 3, Summary of research 1955 is presented by country, viz.;

Canadian research (p. 21-27), by W. Templeman and W. R. Martin, deals with hydrography; haddock, its occur-

rence, age composition, migration; redfish, its occurrence, size composition, growth, etc.

Danish research report on cod in West Greenland coastal waters and offshore banks, by P. M. Hansen (p. 27–34) deals with occurrence of cod eggs and fry, composition of cod catches, migration, tagging, etc. Hydrographic conditions in the eastern Labrador Sea and Davis Strait including ice and temperature distribution, salinity, phosphates are reported by F. Hermann, who discusses also temperature and salinity along sections: Faroes to East Greenland and Cape Farewell-West Ireland (p. 34–38).

French temperature and hydrographic observations in the Davis Strait and between Cape Farewell and Newfoundland are reported (p. 39) by J. Ancellin.

German research in the Greenland and Iceland area reported by J. Lundbeck (p. 39-42) includes hydrography; cod landings, age composition and size; redfish studies, etc.

Icelandic research on age composition of codfish caught off West Greenland, is presented (p. 42) by Jón Jónsson.

Norwegian research reported by Birger Rasmussen (p. 43–47) is concerned with West Greenland fisheries, hydrography, cod catch composition (age and size), tagging of cod and halibut, conversion factors.

Portuguese research reported (p. 47–55) by Mario Ruivo covers cod, its age and size distribution, sex ratio, age at first maturity, growth, parasites. The material analyzed originates from a large area of West Greenland and Labrador waters.

Spanish research (p. 55-63), by Olegario Rodriguez Martin and Alfonso Rojo, covers investigations in the waters off Newfoundland on cod and haddock, their size, age, maturity, food, growth, size-weight relations, etc.; also water temperatures.

United Kingdom research (p. 63-64) by C. E. Lucas and R. S. Wimpenny deals with age and size distribution of cod from southwest Greenland (Subarea 1) and with otolith studies.

U. S. Research, by Herbert W. Graham, deals with haddock population, food, growth, etc., cod; redfish, flounder, etc. hydrography.

Data of these reports are coordinated by E. M. Poulsen (p. 67-74) in a summary of the 1955 work according to the Commission's subareas and to fields of re-

A review of the whole area and search. adjacent waters concludes the proceed-Copy seen: DI. ings.

Contains (in pt. 1, p. 7-18) a summary of the fishery in the area for all ten Convention members and Germany. Pt. 2 (p. 19-58) offers tables of statistics for the same area and period (1954). While previous reports covered only ground fish, cod, haddock, redfish, halibut, flounder, etc., the present account includes other species, pelagic and estuarine species, shellfish, etc. landed also, 73 species in all, offering a complete picture of marine resources utilized. All figures on landing are given in metric tons round fresh. Conversion factors are also included. Previous reports are listed as No. 34244, 35388, 40507B.

INTERNATIONAL GEOPHYS-ICAL YEAR, 1957-1958. Special Committee. CSAGI Arctic Conference, Stockholm, May 22-25, 1956. (In: I. U. G. G. News letter, Sept. 1956. 5° année, no. 15, p. 368-92.)

The 61 delegates who attended the Comité Spécial de l'Année Géophysique Internationale conference are listed; they represent 12 countries planning arctic observations in the International Geophysical Year; brief report of the proceed-Working groups were ings is given. formed to study the program in: meteorology, geomagnetism, aurora, ionosphere and arctic telecommunications for IGY messages, glaciology, seismology, and gravimetry; also (later) a group to deal with CSAGI publications and a continuing group on arctic IGY communications. The following papers presented are listed in this Bibliography under their authors' names, viz:

DAVITAIA, F. F. The programme of meteorological observations in the Arctic

during IGY.

BARTELS, J. Geomagnetic observatories in polar regions.

CHAPMAN, S. The IGY auroral pro-

NEWELL, E. The use of rockets in the IGY.

SHAPLEY, A. H. The ionosphere programme in the Arctic.

The resolutions adopted at the Conference are listed by subject (as above). They include recommendations for: the establishment of an aerological and actinometric station on the Greenland icecap; standardized and more extended surface measurements of ozone; cosmic ray measurements by transpolar aircraft flights; and regular aerial photographic traverses Copy seen: DLC. of the Arctic Basin.

45706. INTERNATIONAL GEOPHYS-ICAL YEAR, 1957-1958. Special Committee. Meeting of the Special Committee of the International Geophysical Year, Rome, 30 Sept.-4 Oct. 1954. [London?] 1954? 12 pts. separately paged. maps. Mimeographed.

Reports are presented of the groups on world days, meteorology, geomagnetism, aurora and airglow, ionosphere, solar activity, cosmic rays, latitudes and longitudes, glaciology, oceanography, and rockets. The Assembly's transactions, resolutions and recommendations are given. Stations and program of work, etc., for each of the 11 sub-committees named above are presented; as is the work of the sub-committees on geographical distribution (see also No. 45707) and publications and publicity. Chairman and members of the 13 committees are named, and activities of the president (S. Chapman), vice president (L. V. Berkner) and secretary-general (M. Nicolet) in 1953 and 1954 are reported.

Copy seen: DLC.

45707. INTERNATIONAL GEOPHYS-ICAL YEAR, 1957-1958. Special Committee. Second meeting of the Special Committee for the International Geophysical Year (CSAGI), Rome, 30 September-4 October 1954 (continued). XII, Geographical distribution. London, 1955. 79 p. tables. (Its: Bulletin d'information, no. 5) Also pub. as: I. U. G. G. news letter, no. 11.)

"This report lists stations in all parts of the globe, with geographical and magnetic coordinates, proposed for IGY, 1957/58, under headings of meteorology (including ozone, radiation, and spherics stations), geomagnetism, aurora and airglow; ionosphere, solar activity, cosmic ray, latitude and longitude, glaciology, oceanography, rockets, and according to Arctic, Antarctic, Equatorial, 80°-70° W., 10° E., and 140° E. longitude lines. In all, several thousand stations are listed."—
Meteorological abstracts & bibliography, Mar. 1956. v. 7, no. 3, p. 295.

45708. INTERNATIONAL GEOPHYS-ICAL YEAR, 1957-1958. United States National Committee. Proposed United States program for the International Geophysical Year, 1957-1958. Washington, D. C., National Academy of Sciences-National Research Council, Aug. 1956. ix, 109 p. tables.

Current plans for U. S. participation in each of the major scientific disciplines are outlined. Two stations in the arctic ice pack near 78° N. 160° W., and 85° N. 100° W. are to be occupied. The Arctic Institute of North America plans to occupy a glacier in the eastern Brooks Range in North Alaska for a period of 15 months to carry out detailed glaciological investigations. Other stations will be manned in Alaska and Greenland. All stations are listed according to geo-

graphic region and meridian lines together with the principal programs of study.

45709. INTERNATIONAL GEOPHYS-ICAL YEAR, 1957-1958. United States National Committee. United States program for the International Geophysical Year, 1957-58. Washington, D. C., National Academy of Sciences-National Research Council, Aug. 1955. 108 p. 3 charts, 14 tables.

The Committee's plans as of Sept. 1955, and those of various panels (13 fields of research) are described in turn, with calendars of world days, list of stations and their coordination and observing program in each discipline. The geographical distribution of all IGY stations is given according to latitudinal, auroral and longitudinal belts; charts show location of stations; members of each panel are named; and other details are given of the U.S. program which includes Alaska and places from the North to the South Pole, in the Pacific Islands, the Atlantic, and seven stations in South America. 45713. IONIN, A. S., and P. A. KAPLIN. Osobennosti formirovanifa morskikh terras. (Akademifa nauk SSSR. Izvestifa, serifa geograficheskafa, Sept.-Oct. 1956. no. 5, p. 9-21, illus., graphs.) 10 refs. Text in Russian. *Title tr.:* Peculiarities in the formation of marine terraces.

Formation of Quaternary seashore terraces is outlined, and erosion terraces are distinguished from accumulation terraces. Movement of the shore line (regression or transgression of the sea) and its speed, stability of the shore rocks, and wave action are factors in building terraces; their interrelation is discussed and exemplified, chiefly, from the Novaya Zemlya, Chukotka and Kamchatka coasts. The difficulty of reconstructing the paleogeographic processes of coastal bank formation is stressed.

**45715. IRVING, LAURENCE, 1895** - Influences of Alaskan research on the progress of science. (*In.*: Alaskan Science Conference . . . 1952. Proceedings pub. 1954, p. 1–5.)

Some advances in knowledge and thinking are presented as resultant from work of explorers and scientists, viz.: Steller and Cook in the 18th century; Dall and men of the U. S. Army, Navy, and Revenue Service in the 19th; Murdoch and Ray at Barrow during the first International Polar Year, 1882–83; Lt. Stoney in northern Alaska in 1885; Stefansson, Leffingwell, and Wilkins in the early 20th century; and in mid-20th century, the work of J. L. Giddings, and the U. S. Air Force. Travels of arctic Alaskan Eskimos up to about 1900, are also cited.

45716. IRVING, LAURENCE, 1895—, and others. Metabolism and insulation of swine as bare-skinned mammals. (Journal of applied physiology, Nov. 1956. v. 9, no. 3, p. 421–26, illus., tables) 19 refs. Other authors: L. J. Peyton and M. Monson.

Contains a study of metabolism and skin temperature in young Alaskan swine exposed to temperatures of +20 to -30° C. Critical temperature, heart beat, behavior of peripheral blood vessels, etc., were also recorded and integrated with the overall observations. The peripheral tissue was found to possess a heterothermous capability offering a high degree of insulation to the body.

45717. IRVING, LAURENCE, 1895—, Nocturnal decline in temperature of birds in cold weather. (Condor, Nov.— Dec. 1955. v. 57, no. 6, p. 362–65, tables.) 9 refs.

Report on body temperature of seven species of Alaskan birds held in captivity at Anchorage. In the winter with air temperatures of  $-9^{\circ}$  to  $-22^{\circ}$  C. body temperature remained unchanged during the day, but fell 0.9° to 4° C. during night time. This decline is attributed to lack of activity during sleep and rest.

**45718.** IRVING, LAURENCE, 1895—. On the various directions of bird migrations through arctic Alaska. (*In:* Alaskan

Science Conference . . . 1953. Proceed-

ings, pub. 1956, p. 178-79).

A systematic summary of areas crossed by migratory species nesting on the tundra of interior of northern Alaska. In addition to 67 from the American continent, four are from Asia, two from the Pacific Islands and 19 from the North Pacific.

Copy seen: DGS.

45719. IRVING, LAURENCE, 1895—. Physiological insulation of swine as bare-skinned mammals. (Journal of applied physiology, Nov. 1956. v. 9, no. 3, p. 414–20, illus., table.) 15 refs.

Account of temperature records of the skin and the underlying tissues in swine during winter and summer in Alaska. Measurements of various body regions were made both at rest and in action and temperature gradients established up to depths of 45-70 mm., where a practically constant  $38.4^{\circ}\pm0.5^{\circ}$  C. prevailed. Conditions are discussed and compared with those in man. Copy seen: DNLM.

45720. IRVING, LAURENCE, 1895-, and J. KROG. Temperature during the development of birds in arctic nests. (Physiological zoology, July 1956. v. 29, no. 3, p. 195-205, illus. tables.) 22 refs.

Account of investigations conducted on seven nesting species at Anaktuvuk Pass (68°19' N. 151°26' W.) Northern Alaska. Median of 49 temperature records during incubation was between 33° and 35° C. with 74 percent of the records between 37° and 33°. Temperature maintained in the nest by parental behavior was essentially homoiothermous and unaffected by weather or climate. Among the nestlings 71 percent of the temperatures were between 42° and 36°C. with a median of 38° C. Growth proceeds at temperatures more stable than that of adult birds which can change 6° C. from sleep to full activity. Nestling stage (of Fringillidae) is about one day shorter than in temperate climate.

Copy seen: DLC.

45721. IRVING, LAURENCE, 1895, and S. PANEAK. The weight and nutritional status of birds at the arctic terminus of migration. (In: Alaskan Science Conference . . . 1952. Proceedings, pub. 1954, p. 212.)

"Six years' observations and measurements of migrant birds arriving in arctic Alaska have revealed no evidence of lack of food or other physiological stress during migration. Generally excellent condition of arriving birds would seem to indicate that timing and direction of migration coincide with northward spring wave of developing food supplies."

The results of experiments on various

types of snow are discussed, and the method of measurement is described. The flow of air through snow is similar to that through granular, porous materials. The resistance to air flow is low in new snow of small density, medium in granular snow of high density, and high in settled snow of medium density. Specific surface (cm<sup>2</sup>/g<sup>2</sup>) and mean hydraulic diameter of snow particles are considered as useful characteristics of snow as the density. Data are tabulated and graphed.—From SIPRE. Copy seen: DLC.

Study of grass growth on an experimental peat meadow in the Kirov region is described. Effects of drainage of the peat bogs at various depths, influence of different levels of ground water, and of the thickness frozen ground were investigated. Results of the observations are tabulated and plotted on set of curves. The most satisfactory results were obtained with drainage at the average of the various depths of ground water during the recorded vegetation periods.

Khibiny massif.

Search for new deposits in the pyrrhotite zone of the Kukisvumchorr is described in respect to petrographic characteristics. The lithological zone consists mostly of dense mica-hornblendenepheline syenites containing pyrrhotite. Molybdenite (MoS<sub>2</sub>) is dispersed unevenly in the pyrrhotite zone. Genetically the deposit is connected with residual magma (with syenites) rich in mineralizers (fluorite, eucolite) and bound with them by pegmatitic processes. Analysis of dispersal molybdenite showed it, on average, only 0.05 percent metallic (Mo). Its even distribution presents difficulties for recovery, hence its industrial development is uneconomic despite of advantageous geographic location and large geochemical reserves.
